Planning of Water Resources of Rajasthan State

Report Number:

4.4

Report Name:

Groundwater

Background: Over 2013-2014, a consortium of firms led by Tahal Group produced a set of reports on the subject for the Government of Rajasthan. 9 reports were produced, as follows:

Report No.	Report Name
4.1	Hydrology and Weather
4.2	Basin-wise water availability
4.3	Catchment area study
4.4	Groundwater
4.5	Water pollution
4.6	Water supply demand
4.7	Identification of new projects
4.8	Identification of projects to be rehabilitated
4.9	Comprehensive water resources plan

With some exceptions, all the above reports have been uploaded on archive.org and may be found by searching for "Planning of Water Resources of Rajasthan State"

Final Report No. 4.4

1. Executive Summary

The report deals with the groundwater situation of the 10 agro climatic zones (ACZ) of Rajasthan. The agro climatic zones have been defined according to the prevailing climatic conditions in each zone, i.e. hyper-arid, arid, semi-arid, sub-humid and humid - and according to the crops grown in the zone, irrigation, etc.

The main objective of the report is to present up-to-date status of ground water conditions in the state by Agro Climatic Zones.

Methodology adopted includes data collection, data validation, data verification and data processing that resulted in preparation of ground water resource characteristic maps as well as compilation and assessment of dynamic and static ground water resources. The methodology comprised access to and visualization and analysis of primary data as well as desk study of available maps and published information. Given the information an analysis was undertaken for characterization of aquifer system and evaluation of long-term decline in levels of ground water, changes in ground water resources and ground water quality. The analysis has been done by taking into consideration the geology and hydrogeology of complex aquifer systems of various ACZs. Detailed assessment of ground water availability in alluvial, sedimentary and hardrock aquifers includes present status of ground water resources and changes in these resources over the period of time. Extensive agricultural land use and dynamic hydrologic connection between land surface and ground water has inversely rendered the aquifers vulnerable to chemical contamination as revealed through nitrate and fluoride levels of ground water in the area in relation to land use practices and geo-genic factors.

Groundwater observation-well data of Central Groundwater Board (CGWB) and Rajasthan Groundwater Department (RGWD) were compiled and used for the purpose of preparing depth to groundwater level maps, groundwater quality maps (salinity, chloride, nitrate and fluoride), groundwater level contour maps, and more. All the data are enclosed in annexes and presented as tables and maps along with this report. The data of a total 7611 observation wells of RGWD and 1588 observation wells of CGWB were considered for preparation of water-table contour maps, pre-monsoon and post-monsoon depth to water level and groundwater quality maps for year 2010.

The entire state is classified into 19 hydrogeological units and described ACZ-wise. The locations, extent and nature of aquifer units have been determined; groundwater recharge and abstraction quantities evaluated; potential yield of wells and aquifers estimated; and groundwater chemical quality parameters described.

Block-wise and Aquifer-wise condition of ground water level trends have also been analysed for each of the ACZs. The long-term declining trend in the ground water levels have been analysed for the period 1984-2010. Rates of ground water decline vary widely from a minimum of 0.01m/yr in Kumher block to a maximum of 1.88m/yr in Behror block of Alwar district. Periodic rise in ground water levels for years of good rainfall have also been observed.

Ground water quality maps based mainly on four parameters chloride, fluoride, nitrate and electrical conductivity levels have been prepared for each ACZ. Seasonal changes in ground water quality based on hydro- chemical time-series data have been prepared and annexed. Mixed changes in chemical characters of ground water are noticed between pre and post monsoon analytical results.

The net dynamic fresh ground water availability for the state is assessed as 10613.83 Mm^3. It varies from 456.54 Mm^3 in ACZ Ic to 1907.60 Mm^3 in ACZ IIIb. The total saline dynamic ground water availability in the state is assessed as 3621.96 Mm^3 and it ranges from 2.75 Mm^3 in ACZ V to 1613.75 Mm^3 in ACZ Ib.

Similarly, the static ground water resource in the state (fresh) is assessed as 32914.17 Mm^3 and saline as 29725.51 Mm^3. The static (fresh) ground water resources range from 87.67 Mm^3 in ACZ IVb to as high as 8787.44 Mm^3 in ACZ Ic.

The village wise suitability of ground water quality for different uses is also assessed. Out of 41,704 villages (as per census 2001) in various ACZs, 21041 have been found suitable for drinking water use, 26191 suitable for irrigation water use and 36827 suitable for livestock water use.

Summary of individual Agro Climatic Zone is given below:

ACZ Ia

The Agro Climatic Zone Ia covers an area of 45,577.83 km^2 in the south western part of the state includes 15 blocks in district Barmer and Jodhpur.

The main hydrogeological formations of the ACZ are Younger & Older Alluvium of Quaternary to Recent age Vindhyan Sandstone and Bilara Limestone of Marwar Super Group Tertiary Sandstone, Jalore Granite and Rhyolite of post Delhi age.

The average depth to water during pre-monsoon 2010 ranges between 5.00 and 60.00 meters bgl with an overall average of 40.00 m. At some locations the depth to water level have been recorded below 150 meters from ground level in western and south-western part of Barmer, central and northern part of Jodhpur district. The average fluctuation (1984-2010) in the ACZ varies between 0.61 m and 2.72 meters.

Long term groundwater level (1984-2010) trend indicate the rate of decline as -0.14 m/yr in Barmer district whereas the rate of decline in Jodhpur district is -0.22 m/yr which is almost double the rate recorded in Barmer district. Majority of blocks covering both the district show declining trend up to -0.25 m/yr expect Bap block of Jodhpur district and Barmer block of Barmer district show slightly rising trend. The maximum declining rate of -0.78 to -0.95m/yr was observed in Bawari and Phalodi block of Jodhpur district respectively.

Groundwater draft between the year 1995 and 2009 indicates 8.76% increase in draft in Barmer district, whereas in Jodhpur district it has increased to more than 111% in the same period.

Groundwater in the major part of the ACZ is found unsuitable for drinking as per the values of all 4 parameters of Chloride (Cl), Electrical Conductivity (EC), Nitrate (NO_3) and Fluoride (F).

Out of total 15 blocks only two blocks *viz* Barmer block of Barmer district and Bap block of Jodhpur district have the stage of groundwater development and categorised as "safe", Luni block of Jodhpur district having stage of development of 82.42% is categorised as "semi-critical". Two blocks *viz* Chohtan and Sindhari of Barmer district have stage of development 99.22% and 98.41% respectively are categorised as "critical". The remaining blocks have stage of development of more than 100% and are categorised as "Over-exploited".

Looking to the high rate of extraction of groundwater gradual reduction of extraction is recommended in order to return to sustainable management. Starting from the year 2020 groundwater pumping should be reduced by ~ 5% each year, meanwhile the water sources may either be developed, conserved, augmented and or imported.

The dynamic fresh ground water availability in ACZ is assessed as 465.10 Mm^3. The static ground water resource availability in the ACZ is 11009.88 Mm^3 out of which fresh static groundwater availability is 7413.16 Mm^3 and static (saline) groundwater resource is 3596.72 Mm^3.

Out of total 2,713 villages in ACZ, 303 are fit for drinking, 407 for irrigation water use and 1,811 for livestock water use.

ACZ Ib

The Agro Climatic Zone Ib covers Ganganagar and Hanumangarh district, having an area of 20,620.77 km^2 in the northern part of the state.

The main hydrogeological formation in the ACZ is Younger & Older Alluvium of Quaternary to Recent Age. The depth to groundwater level pre-monsoon 2010 ranges from 5.00 to 40.00 meters below ground level with in average of 15 m. Average fluctuation of ground water (1984-2010) ranges from -0.11 m to +0.77 m.

Long term groundwater level trend recorded in Ganganagar district is 0.40 m/yr whereas in Hanumangarh district the rise is moderate i.e. at the rate of 0.19 m/yr. In both the districts, groundwater level trend show moderate rise, except in Tibi block of Hanumangarh district which show average decline at the rate of upto 0.09 m/yr.

Groundwater draft between the year 1995 and 2009 in Ganganagar is stable and stays almost unchanged whereas in Hanumangarh district it has increased by 27%.

In respect of chemical quality of groundwater the values of Cl are within permissible limit (except in the western part in Raisinghnagar, Anupgarh, Suratgarh block in the central part of the Ganganagar district) and suitable for drinking purpose whereas EC values indicate that isolated patch distributed all over the ACZ are unsuitable for drinking purpose. Values of F and NO_3 vary widely from permissible to unsuitable limits.

The Stage of groundwater development in most part of ACZ is below 75%. Only Suratgarh block of Ganganagar district and Hanumangarh, Nohar and Tibi blocks of Hanumangarh district exhibits the value from 75% to 90% but still comes under "safe" category, as no decline in water levels either in pre-monsoon or in the post-monsoon have been observed.

ACZ Ib presents a moderate increase in drafts during 1995-2009 due to the developed surface water irrigation system. Significant leaks from the canal to the sub surface are responsible for the rising trends of the water table in this dry desert (in both Ganganagar and Hanumangarh districts). Accordingly, the category of most blocks in this ACZ is ‘Safe’. The chloride concentration and Electrical Conductivity are high but typical to the irrigated north western parts of the state. In order to reduce the salinization process it is recommended to implement advanced irrigation system such as “Drip Irrigation”.

The dynamic fresh ground water availability in ACZ is assessed as 488.12 Mm^3. The static resources are assessed as 5808.66 Mm^3, out of which 4588.18 Mm^3 are saline ground water resources.

Out of total 4,957 villages in ACZ, 2091 are fit for drinking water use, 1851 for irrigation use and 4077 for livestock water use.

ACZ Ic

The Agro Climatic Zone includes 12 blocks in Bikaner, Jaisalmer and part of Churu district. It covers an area of 77,001.84 km^2. The main hydrogeological units are Younger & Older alluvium of Quaternary to Recent age, Tertiary sandstone, Jurassic sandstone, Nagaur Sandstone and Bilara Limestone of Marwar Super Group and Phyllite & Schist of Delhi Super Group.

The depth to groundwater level pre-monsoon 2010 ranges between 10.00 and 60.00 m bgl with an average of 49.00 m bgl. Maximum fluctuation in the area has been observed as 9.50 m.

The long term groundwater trend indicates rise at the rate of 0.10 and 0.14 m/yr in Bikaner and Jaisalmer district respectively whereas in Churu district area moderate decline at the rate of -0.06 m/yr has been recorded.

Comparison of groundwater draft between the year 1995 and 2009 shows increase of >100% in all the blocks except Ratangarh and Sardarshahar blocks of Churu district.

In respect of groundwater quality the values of Cl are within permissible limits for drinking purpose except south-western part of Bikaner and Jaisalmer district, eastern part of Bikaner district and western part of Churu district. As regards the other parameters like EC, F and NO_3 the values are not within permissible limits and hence unsuitable for drinking purpose.

Regarding the groundwater development in the ACZ, only 4 blocks have stage of development below 82% and are categorised as "safe" *viz* Kolayat and Lunkaransar blocks of Bikaner district and Ratangarh and Sardarshahar of Churu district. One block *i.e.* Sam block of Jaisalmer district having stage of development of 94.70% comes under "Critical" category whereas the remaining 6 blocks are categorised as "Over-exploited" and have stage of development more than 100%.

ACZ Ic presents rapid growth of groundwater drafts from the year 1995 to 2009. In spite of this the draft ratio per unit area are still low in most of the blocks. Like in ACZ Ib, the IGNP canal system keeps a positive ground water balance in the aquifer due to heavy seepage from the canal. This positive water balance is reflected by a moderate increase of the groundwater level in 4 blocks which are under "safe" category. Yet, the western edge of the ACZ, close to Churu district, is effected by the over-exploitation in ACZ IIa reflected by the water table decline. Significant salinization, especially in the western side of the ACZ is taking place. The nitrate concentrations are also high. The pattern of positive water balance and high levels of chlorides and nitrates is typical to the north western ACZ's.

The dynamic fresh ground water availability in ACZ is assessed as 456.54 Mm^3. The static resources are assessed 27301.34 Mm^3, out of which 18513.90 are saline ground water resources.

Out of total 1,961 villages in ACZ, 407 are fit for drinking water use, 494 for irrigation use and 1469 for livestock water use.

ACZ IIa

Agro Climatic Zone IIa covers an area of 37,054.95 km^2 in the north eastern part of the state. It includes 30 blocks in 4 district viz. Nagaur, Sikar, Jhunjhunu, and part of Churu districts.

The main hydrogeological formation in the area is Younger & Older Alluvium of Quaternary to Recent age, Tertiary Sandstone, Vindhyan Sandstone and Limestone of Marwar Super Group, Phyllite & schist and Quartzite of Delhi Super Group. General depth to water level pre-monsoon 2010 ranges between 20.00 m bgl to 80.00 m bgl with an average of 44.00 m bgl. Average fluctuation is 0.45 m with minimum of -0.94 m and maximum of 4.47 m. The long term (1984-2010) water level indicates decline of -0.38 to -0.55 m/yr in 3 districts viz. Jhunjhunu, Nagaur and Sikar. Churu district displays stable groundwater levels.

Comparison of Groundwater draft from the year 1995 to 2009 indicates that Sikar district have recorded minimum increase of 15% where as Nagaur and Jhunjhunu districts have recorded maximum increase of 70% while Churu district display highest increase of 157.50%

The Agro Climatic Zone displays wide variation in the chemical quality in respect of all 4 major ions from permissible limit to unsuitable for drinking purpose. Only in few blocks viz. Khetri, Nawalgarh, Piprali, Sri Madhopur and Udaipurwati the groundwater has been found suitable for drinking.

In respect of groundwater development, only 4 blocks have stage of development less than 100% out which one block i.e. Churu block of Churu district comes under "safe" category one block i.e. Fatehpur block of Sikar district comes under "Semi-Critical" category and two blocks *viz* Ladnu and Nagaur of Nagaur district are categorised as critical. Rest 21 blocks have stage of development more than 100% and are considered as “Over Explored”. Entire Taranagar block of Churu district have saline groundwater.

The dynamic fresh ground water availability in ACZ is assessed as 1082.83 Mm^3. The static resources are assessed 6988.51 Mm^3, out of which 1829.14 Mm^3 are saline ground water resources.

Out of total 3,828 villages in ACZ, 1220 are fit for drinking water use, 1736 for irrigation use and 2954 for livestock water use.

ACZ IIb

The Agro Climatic Zone IIb occupies an area of 31,656.93 km^2 in the south western part of the state on the western flank of Aravalli hill range. The ACZ includes 24 blocks in 4 districts viz. Pali, Jalore and part of Jodhpur district (Bilara and Bhopalgarh blocks) and Sirohi district (Sirohi, Sheoganj and Reodar blocks).

The main hydrogeological units of the area are Phyllite and Schist and Gneisses of Delhi Super Group, Erinpura and Jalore Granites of post Delhi’s and Younger and Older Alluvium of Quaternary to Recent age.

In general the depth to groundwater levels pre-monsoon 2010 in the ACZ ranges from 5.00 to 60.00 metres bgl with an average of 26 m. The fluctuation of water level has an average of 3.82 m.

The long term water level trend (1984 to 2010) show decline is almost entire zone area. The maximum rate of decline of -1.17 m/yr has been recorded in Bhinmal block of

Jalore district. The only exception is Chitalwana block of Jalore district where long term water level shows rising trend of 0.01 m/yr. In all it ranges from -0.08 m/yr in Pali district to -1.10 m/yr in Barmer district.

The total annual draft in this ACZ is 1788.69 Mm^3, which is very high value and is the main cause of water level decline in the zone area. Only two blocks, Siwana of Barmer district and Sheoganj of Sirohi district have recorded significant increase in groundwater draft of more than 100%.

The chemical quality of groundwater has been studied in respect of 4 parameters i.e. EC, Cl, F and NO_3. As per the analysis of chemical quality data Cl value in 16 blocks and NO_3 values 13 blocks are within permissible limits for drinking purposes. However the values of NO_3 in 7 blocks out of 13 have exceeded the maximum permissible limits of 100 mg/l in the last 5 years. In case of EC values, 19 blocks have recorded above permissible limits. F values in 22 blocks have been found above permissible limits. Rani block in Pali district is the only block where long term average levels of all parameters are suitable for drinking purpose.

Out of 24 blocks 21 blocks have stage of groundwater development above 100% and are categorised as "Over-Exploited". Sumerpur and Rohat blocks of Pali district comes under "Critical" category whereas Pali block of Pali district is categorised as "Semi-Critical".

ACZ IIb presents a high annual draft of over 1788.69 Mm^3. The draft per unit area ratio is also high, especially around the alluvial plains of the Luni basin and in northern blocks of Jodhpur district. Significant (>0.22 m/yr) groundwater level decline was recorded in most blocks. It is assumed that the unusual decline in drafts in the last 15 years in 15 blocks is a result of operational limitations due to the declining water levels in the wells. Extremely high chloride levels were recorded mainly in the blocks on the western periphery of Pali district. Correlation was found between the chloride distribution pattern and the depth to the water table. The dynamic resources in the ACZ are limited therefore; considerable amounts of the annual consumption are being pumped from the static storage. As these volumes are not renewed in the aquifer, the over-draft is growing higher year by year. The only way for returning back to balanced conditions is a long term plan, for gradual decrease of the water requirements for agriculture and other uses and by using advance irrigation technologies.

The dynamic fresh ground water availability in ACZ is assessed as 1041.51 Mm^3. The static resources are assessed 5061.29 Mm^3, out of which 606.97 are saline ground water resources.

Out of total 2,249 villages in ACZ, 397 are fit for drinking water use, 845 for irrigation use and 1695 for livestock water use.

ACZ IIIa

The Agro Climatic Zone is located in the central part of the state on the eastern flank of Aravalli hill range which runs NE-SW. It includes 31 blocks covering 4 districts viz Ajmer, Dausa, Jaipur and Tonk, and covers an area of 29,512.93 km^2.

The main hydrogeological formations in the ACZ are Younger and Older Alluvium of Quaternary to Recent age, Phyllite & Schist, Quartzites and Gneisses of Delhi Super Group and Gneisses(B.G.C.) of Bhilwara Super Group.

The depth to groundwater pre-monsoon 2010 ranges between 5.00 m and 60.00 m bgl with an average of 21 m. The average fluctuation of groundwater ranges from less than 1 m to 9.20 m bgl. The maximum fluctuation recorded in the zone is 10.70 m.

All the blocks in the ACZ exhibit declining trend in respect of long term water level trend from the year 1984 to 2010. In the ACZ, Tonk and Ajmer district have recorded moderate decline of the order of -0.04 to -0.24 m/yr, whereas Jaipur and Dausa district show significant decline of -0.58 to -0.65 m/yr.

The groundwater draft comparison from the year 1995 to 2009 show significant increase in the year from 1698.84 Mm^3 in the year 1995 to more than 2585.23 Mm^3 in 2009. Among the district, Ajmer and Jaipur have recorded 58% and 60% increase in draft respectively. Increase in draft is 30% in Dausa and Tonk districts.

The chemical quality of ground has been studied on the basis of 4 parameters i.e. EC, Cl, F and NO_3. Only 8 blocks have been found suitable as per the criteria of drinking water in all 4 parameters. Although values of Cl are well within permissible limit in all the blocks, but the on basis of other 3 parameters the groundwater has been found unsuitable for drinking purpose.

Regarding groundwater development a large portion of ACZ covering 27 blocks is under "Over Exploited" Category. Two blocks each are under "Critical" and "Semi-Critical" categorise.

The dynamic fresh ground water availability in ACZ is assessed as 1591.61 Mm^3. The static resources are assessed as 2138.73 Mm^3, out of which 53.05 Mm^3 are saline ground water resources.

Out of total 5,272 villages in ACZ, 2671 are fit for drinking water use, 3675 for irrigation use and 4929 for livestock water use.

ACZ IIIb

The Agro Climatic zone covers an area of 24,431.80 km^2 in north eastern part of the state. It includes 35 blocks covering Alwar, Bharatpur, Dhaulpur, Karauli and parts of Dausa (Mahuwa block) and Sawai Madhopur district (Bonli, Bamanwas and Gangapur City blocks).

Main hydrogeological formations in the zone area are Younger and Older alluvium of Quaternary to Recent age, Slate, Phyllite & Schist, Limestone and Quartzite of Delhi Super Group and Bhander Sandstone of Vindhyan Super Group.

Average depth to groundwater per-monsoon 2010 ranges from 5.00 m (bgl) to 40.00 m (bgl) and average fluctuation in the ACZ is 2.12 m.

The long term groundwater level trend (year 1984 to 2010) show declining trend in the zone ranging from minimum of 0.03 m/yr in Kumher block, district Bharatpur to 1.33 m/yr in Behror block of Alwar district during pre-monsoon season.

During the post monsoon season the rate of decline varies between -0.02 m/yr (Deeg block district Bharatpur) to -1.38 m/yr in Behror block of Alwar district. This is the highest rate of decline in water level (-1.38 m/yr) in the entire ACZ.

The groundwater abstraction for agriculture use between the year 1995 to 2009 shows rising trend in the zone area. Alwar district have recorded highest draft. It is steadily rising in the year 1995 from 948 Mm^3 to 1,232 Mm^3 in the year 2009. Other district of the zone also exhibit steady rise in draft from the year 1995 to 2009.

The chemical analysis of groundwater indicates that about 50% of the ACZ area is having potable quality of groundwater in respect of chloride. The maximum poor quality area 90% to 100% occurs in Behror and Rajgarh block of Alwar district.

High range of NO_3 levels in groundwater (>100 mg/l) occur in isolated patches in Bharatpur and Sawai Madhopur districts. Fluoride concentration of more than 1.5 mg/l also occur in isolated patches throughout the zone area. In respect of EC a large portion of the ACZ is having poor quality of groundwater especially in Bharatpur, Alwar, Dhaulpur and Sawai Madhopur districts where it ranges between 2250 and 5000 micromhos/cm.

The stage of groundwater development in Alwar district is above 100% and in 4 blocks *viz* Behror, Kathumar blocks of Alwar district and Hindaun and Todabhim blocks of Karauli district it even reaches more than 200%. The consumption pattern clearly indicate that the ground water declines are high in the northern part of the ACZ while in the southern and eastern parts of the ACZ the rate declines is significantly moderate. In general the ACZ is under "Over Exploited" category.

The dynamic fresh ground water availability in ACZ is assessed as 1907.60 Mm^3. The static resources are assessed 3021.19 Mm^3, out of which 525.79 Mm^3 are saline ground water resources.

Out of total 5,697 villages in ACZ, 3229 are fit for drinking water use, 3449 for irrigation and 5026 for livestock uses respectively.

ACZ IVa

The Agro Climatic Zone covers a large area of 37,563.35 km^2 in Southern part of the state. It includes as many as 44 blocks in 6 district viz Chittorgarh, Bhilwara, Rajsamand, Udaipur and part of Sirohi district (Pindwara and Abu Road blocks) and Pratapgarh district (Chhoti Sadri and Pratapgarh blocks).

The main hydrogeological unit of the ACZ are Gneisses(B.G.C.), of Bhilwara Super Group, Phyllite and Schists of Aravalli and Delhi Super Group, Gneisses of Delhi Super Group, Lime-stone of Aravalli Super Group and Deccan Traps Upper cretaceous to Lower Eocene age.

In general the depth to water pre-monsoon 2010 in this ACZ ranges between 5.00 and 40.00 meters bgl with an average of 15m bgl. The fluctuation of ground water level (1984-2010) varies between 1.80 m to 10.50 m with an average of 5.44m.

The range of long term groundwater trend from the year 1984 to 2010 shows that except Pratapgarh block of Pratapgarh district, Kotra and Rishabhdeo blocks of Udaipur district all blocks of other districts have recorded declining trend up to -0.23 m/yr.

The groundwater draft pattern between the years 1995 to 2009 presents relatively stable trend between year 1995 & 2004. The draft has drastically increased to almost 1800Mm^3 in the year 2007. In the last two years it has come down to ~1500 Mm^3.

The chemical quality in the ACZ has been established on the basis of 4 parameters i.e. Cl, F, NO_3 and EC. Only chloride levels have been found suitable for drinking purpose in the entire ACZ. Regarding the other 3 parameters as many as 20 blocks are unsuitable for drinking purpose.

Average Cl levels are within permissible standards in most of the blocks, however, the other 3 parameters exhibit a complicated picture in which some of the blocks fall below the maximum limits and some blocks are not suitable for drinking purpose.

A total of 9 blocks are suitable for drinking purpose in respect of all the 4 parameters these are: Amet, Bhim, Deogarh, Jahazpur, Kapasan, Kumbhalgarh, Nimbahera, Kumbhalgarh, and Pindwara.

The stage of groundwater development in "Over-Exploited" blocks ranges from 110.98 to 199.01%. The stage of Groundwater development in the ACZ, out of 44 blocks 37 blocks have stage of development above 100% and are "Over- Exploited" blocks 4 blocks are under "Critical" and 3 blocks are under "Semi-Critical" category.

The total dynamic resources in the zone are 1204.28 Mm^3. The total static groundwater reserves are 280.05 Mm^3 out of which 7.17 Mm^3 contributes to saline groundwater.

Out of total 7,051 villages in ACZ, approximately 4978 are fit for drinking water use, 6040 for irrigation use and 6903 for livestock water use.

ACZ IVb

The Agro Climatic zone IV b is located on the extreme southern part of the state and covers an area of 11,979.32 km^2. It includes 20 blocks of Dungarpur, Banswara and part of Pratapgarh district (Dhariawad & Peepalkhunt blocks) and Udaipur district (Bhinder, Salumber and Lasadiya blocks).

The main hydrogeological formations of the area are Gneisses (B.G.C.) of Bhilwara Super Group Phyllite and Schist & ultra basic of Aravalli Super Group, Cretaceous Lime-stone and Deccan trap of Upper Cretaceous to Lower Eocene age.

Average depth to groundwater in the ACZ has range between 2.00 and 20.00 meters bgl.

The long term groundwater level trend (year 1984 to 2010) presents close to stable trends with minor decline of a few centimetre per year. In Banswara district 5 blocks have recorded rising trend with an average rise rate of 0.22 m/yr.

The groundwater draft from the year 1995 to 2009 show erratic trend in this ACZ. Initially it has increased from ~200 Mm^3 in 1995 to more than ~500 Mm^3 in the year 2007. After that it has come down to ~300 Mm^3 in the year 2009.

The average chemical quality of this ACZ is relatively good as compared to other ACZs of this state in respect of all 4 parameters. Unsuitable quality of groundwater was recorded in the blocks Peepalkhunt (Cl and NO_3) Lasadiya and Salumber ($NO_{3)}$ and Sagwara (F).

The entire ACZ is occupied by crystalline and metamorphic rocks and hence static and dynamic groundwater reserves are exceptionally low. This is attributed to the low transmissivity of the aquifers.

Never the less, the stage of groundwater development is less than 100% in all the blocks of ACZ except Arnod block of Pratapgarh district and Bhinder block of Udaipur district which has been categorized as Over Exploited, 6 blocks are under “Semi Critical” and 2 blocks are under “Critical” category. All other blocks are in ‘Safe’ category.

The dynamic fresh ground water availability in ACZ is assessed as 507.17 Mm^3. The total static resources are assessed 87.67 Mm^3.

Out of total 3,053 villages in ACZ, 2572 are fit for drinking water use, 2981 for irrigation use and 3053 for livestock water use.

ACZ V

The Agro Climatic Zone has a total area of 26,864.08 km^2 in the south eastern part of the state. There are 25 block in the zone and covers the districts, Baran, Bundi, Jhalawar, Kota and 2 blocks of Sawai Madhopur district, *viz* Khandar and Sawai Madhopur.

The main hydrogeological units of this ACZ include older alluvium, Bhander Limestone, Bhander sandstone, Shale, Deccan Traps, Gneisses(B.G.C.) and Phyllite & Schist.

in general the depth to water table in the ACZ ranges from 5.00 to 20.00 meters below ground level with an average of 14 m below ground level. Average fluctuation range from 0.46 m to 10.12 m. The maximum fluctuation of 10.60 m has been observed in the ACZ.

The long term ground water level trend (1984-2010) indicates decline in water level at the rate of -0.03 m/yr to -0.77 m/yr.

A comparison of ground water draft from the year 1995 to 2009 shows increase in the draft from ~1000 Mm^3 in the year 1995 to ~2000 Mm^3 in the year 2009. Districts like Baran, Jhalawar and Kota are the areas of high ground water draft of the order of ~500 Mm^3 each. Itawa, Keshorai Patan, Kishanganj, Sultanpur and Talera blocks have recorded maximum increase in draft of the order of over 250% in the last 15 years.

Study of the chemical analysis of groundwater indicates that in general the quality of groundwater is relatively good and suitable for drinking purposes in majority of the blocks. The average values of NO_3, Cl and EC are within permissible limits. A large area in Kota, Baran and Jhalawar districts of unsuitable quality has been recorded in respect of occurrence fluoride in groundwater.

Dynamic groundwater resources in the ACZ vary between 54.23 Mm^3 (Atru block district Baran) and 128.32 Mm^3 (Itawa block district Kota). Static groundwater resources are below 50 Mm^3 in most blocks. Itawa block of Kota district exhibit exceptionally high values of the order of 155.11 Mm^3.

The stage of groundwater development in the ACZ range from 80% to 187 %. A total of 11 blocks comes under safe category, 5 block fall in Semi Critical, 2 block in Critical category whereas 17 blocks have been categorized as Over-Exploited.

The dynamic fresh ground water availability in ACZ is assessed as 1869.08 Mm^3. The total static resources are assessed 942.35 Mm^3, out of which 459 Mm^3 contributes to saline groundwater.

Out of total 4,923 villages in ACZ, 3,173 are fit for drinking water use, 4,713 for irrigation use and 4,910 for livestock water use.

2. Introduction

The State hydrogeological map has been divided into Agro Climatic Zones, by super imposing ACZ boundaries on it and information groundwater is presented in this report accordingly.

For the preparation of this Report, the Consultants have gathered information from various sources, including State Revenue Department, Rajasthan State Water Resources Department, the Central Groundwater Board and Rajasthan Groundwater Department.

3. Objectives

The main objective of the present study is to evaluate the status of groundwater conditions in the State of Rajasthan by ACZs. The ACZ-wise information of groundwater resources is mainly aimed to serve as input and to plan future crop production possibilities, crop water requirements and cropping patterns.

4. Methodology

4.1 Data Collection

Two main sources of groundwater data were used for the purpose of this work: (1) data from the Central Groundwater Board (CGWB), which includes 1,588 observation wells and (2) data from Rajasthan Groundwater Department (RGWD), which includes 7611 observation wells (see Annex 1).

The data includes exploratory tubewells and peizometer drilling data of CGWB which contains information on depth of well drilled, static water level, well yield, aquifer parameters such as transmissivity and storativity of the aquifers and chemical quality of groundwater. Data also includes information on depth of exploratory tubewells and peizometers drilled by State Ground Water Department, their water yielding capacity, drawdown and chemical quality etc. Well data were rearranged into the following main databases.

* General Information, including

  Well code, coordinates, administrative location (District, Block, village), ground elevation, formations tapped, type of well, source of data.

* Hydrologic Parameters

  Parameters of aquifers collected from results of pumping tests, previous work and published reports of CGWB and RGWD (complete data given in Annex 2(a)).

* Groundwater Levels

  Groundwater level data of pre and post monsoon seasons, both as depth to water below the ground level and ground water elevations in respect of above mean sea level (amsl) for the period 1984 to 2010, were collected from CGWB and RGWD. (complete data given in Annex 2(c)).

* Groundwater Quality Parameters

  Groundwater chemical analysis data in all 33 districts of the state for the periods 1984 to 2010 were collected from CGWB and RGWD. (complete data given in Annex 3a and 3b).

* Groundwater Draft (Abstraction)

  The information was collected from (1) CGWB and RGWD periodically published reports on "Dynamic Groundwater Resources of Rajasthan", in the years 1995, 2001, 2004, 2007, 2009; (2) village-wise data of the existing wells/ tubewells were collected from respective Tehsil headquarters by the Consultants for the year 2010.

A significant part of the data collected were in the form of hard copy. Efforts, of many months, were put into typing the data and to bring them into workable spreadsheets. Other data sets received in soft copy were also in different formats and received at intervals during the course of study. All the data compiled were carefully reviewed and grouped into "excel" format for the use in the preparation of the report.

4.2 Data Validation

Special emphasis was given to data validation. During the screening of the raw data, several inaccuracies, missing data and mismatches in various raw files were found. Data validation included three main types, as schematically illustrated by the flowchart given in Figure 4.1.

The different data validation processes applied by the Consultants are described in the following sub-paragraphs.

Figure 4.1 Summarizes the main types of error and correction introduced into the database. These include:

1) Errors in well code, including: missing well code, incorrect well code and duplicate well code.

2) Completion of missing data, such as formations and location errors.

3) Filling of missing reduced-level

   This mainly included completion of missing data and unification of all values to the same units (meters); all values were modified upto 2 digits after the decimal point. Missing data gaps on reduced level values were filled-in using 90-meters resolution SRTM data.

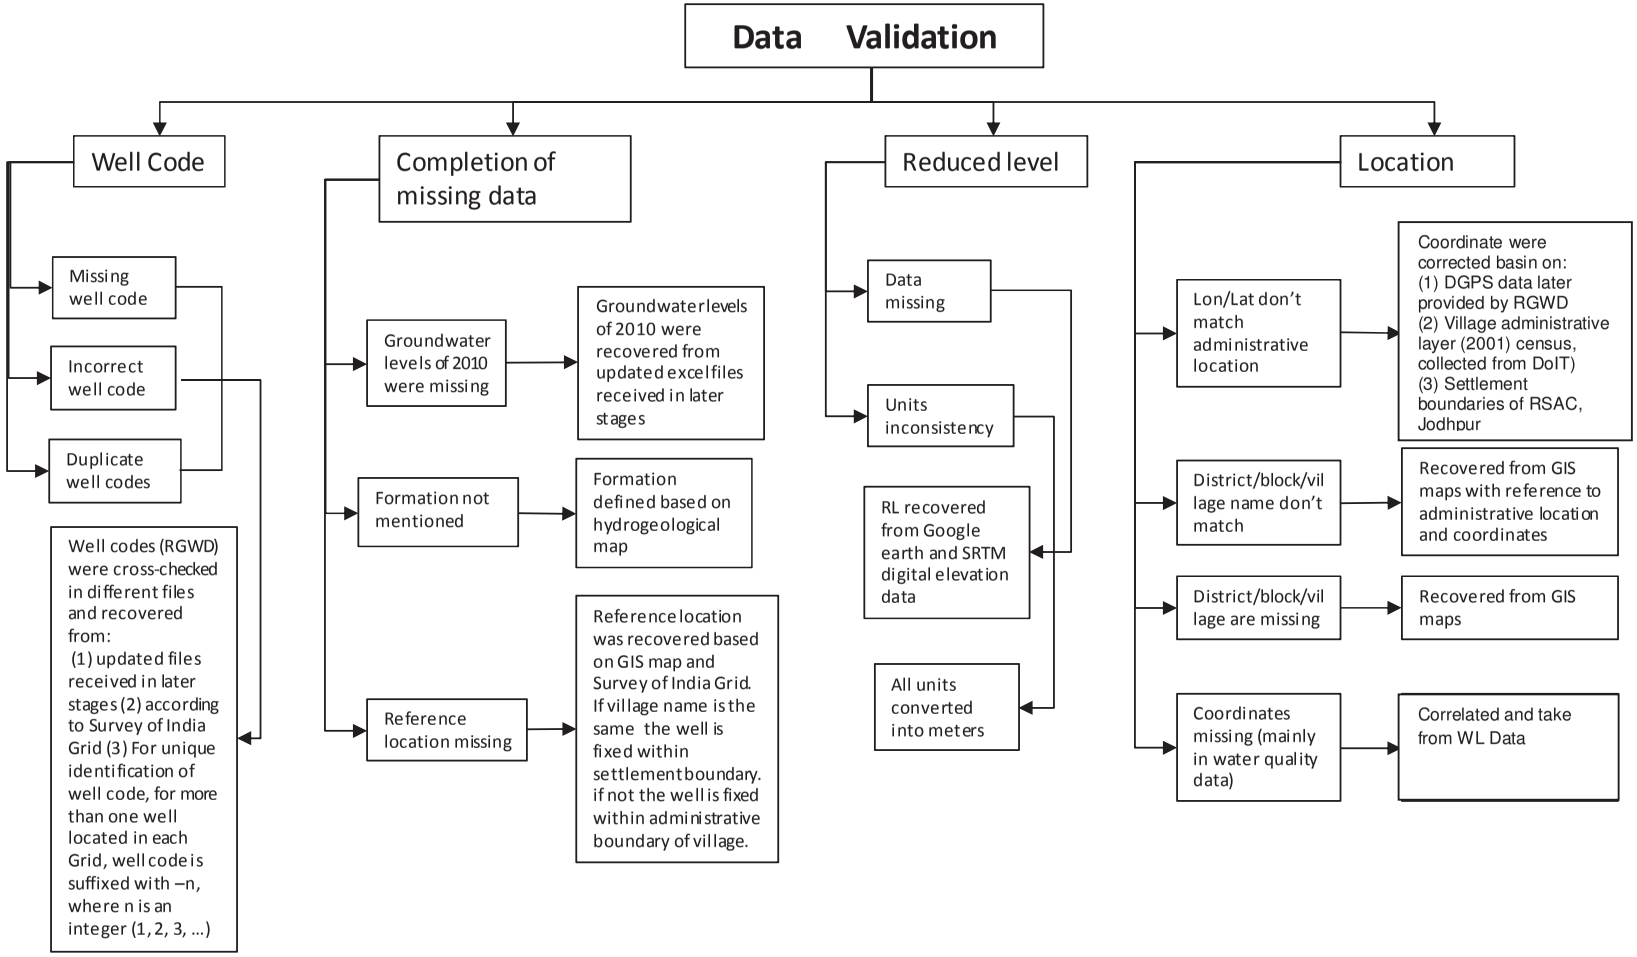
4) Location errors

   Including: coordinates mismatching the administrative location; district name mismatching the block or village name and vice versa; missing district or block or village names; missing coordinates.

Each value was cross-checked thoroughly by more than one person before final correction was introduced. Data that were updated during validation were sent for confirmation to the concerned area hydrogeologists of RGWD and CGWB.

No value was erased from the database even after corrections were made. In order to be able to recover initial values, the original data sets were saved to the next new columns which were added to the spreadsheets that include the corrected value. The same method was adopted for updating of CGWB and RGWD databases, also.

Figure 4.1 Schematic Description of the Process and Main Stages of data Validation



4.3 Completion of Missing Data

For wells that appeared in the datasheet with partially missing data, such as coordinates, formation, district, block, village, etc., data were recovered from other sources or from the maps.

4.3.1 Data Synchronization With Different Files

In some cases, well names and codes appeared slightly differently in different files. These mismatches could have occurred due to typing errors, differences in the spelling of locations, or errors in well identification. This necessitated a laborious task of matching between wells and giving them the same identity codes.

4.3.2 Data Correction

Encountered errors in data, such as well coordinates, well formation, well code, district, block or village name, etc., were mostly found during the projection of the well database on the administrative and hydrogeological maps.

4.3.3 Data Gaps

Groundwater throughout Rajasthan is being extensively monitored and recorded. The RGWD and CGWB data sources comprise together an impressive database of 9199 water level monitoring station. The main parameters being measured are groundwater levels and chemical quality of groundwater. However these sets, especially the groundwater quality database, have many gaps in some of the years, sometimes for few consecutive years, creating a large gap or discontinuity between the two measuring periods. The continuity of data is of prime importance for the sake of following groundwater trends and to enable to predict the future trend. Prediction might help prevention of reaching undesired deteriorated conditions.

The most important missing groundwater parameter is the draft or abstraction. The only method for keeping a sustainable groundwater management requires knowing two factors: (1) the replenished volume and (2) the exploited volume. There is no way of keeping a balanced scheme without measuring the draft. The main problem in this respect is that well are not metered for extraction. (Discharge rates and pumping hours of wells in the state are not monitored).

The published groundwater abstraction estimates are based on general figures and assumptions (not being calculated each year). Groundwater abstraction figures are being published after every 3 years in the Dynamic Resources Assessments periodic reports jointly by CGWB and RGWD (1995, 2001, 2004, 2007, 2009). Groundwater draft figures should normally be available for every year in order to be able to assess the impact of pumping on groundwater levels and qualities.

4.4 Long Term Groundwater Levels and Predictions

The following procedure has been applied for analysing the long-term groundwater levels:

- The well database was validated as above.
- The depth to water table was converted to elevation above mean sea level using reference level (RL) of ground given in m amsl and depth to water level in each well.

- All wells were classified according to Agroclimatic Zones, District-wise/block-wise and aquifer unit wise.
- Groundwater levels data of 1984-2010 were attached to each well and divided into two series namely, for pre and post-monsoon measurements, separately.
- In each Agroclimatic zone, wells with the fullest records were selected. This was done by using 2 criterion, (a) top 50% of the most complete series (wells with the largest dataset) and, (b) no less than 10 measurements for the entire period between 1984 and 2010
- Thiessen polygon method was used in order to define the influence area of each well.
- Linear slope of the long term levels was calculated separately for each well.
- Empty cells (missing data) were retrieved by linear interpolation using the long term slope of the well.
- Weighted average of the groundwater level in every Agroclimatic Zone in each measurement period was calculated based on the Thiessen polygons.
- Two average groundwater level series were produced for each Agroclimatic Zone (pre-monsoon and post-monsoon) and were plotted on the same graph together with annual average rainfall.
- The slope of the average series was calculated in order to gain the average long term rate of water table change.
- Minimum, maximum and average rates per Agroclimatic Zone for pre and post-monsoon were summarised in tables.

Prediction of future groundwater levels and drying of observation wells was done based on the following procedure:

- The prediction was made based on the assumption that the average long term rates of rainfall and drafts will remain similar to the general trends observed in the last 27 years.
- Accordingly, it is presumed that the general trends and average rate of change of groundwater levels will be similar to the average of the last 3 decades.
- Predicted levels in RGWD & CGWB observation wells were calculated by linear interpolation of the average rate of change (slope) per well during the period 1984-2010.
- The procedure was applied for pre and post-monsoon stages separately.
- Predictions were estimated for the years 2020, 2040 and 2060.
- The absolute elevation (amsl) of the bottom of RGWD & CGWB observation wells was calculated based on 'RL' values of ground given in m amsl and the total depth of each observation well.
- Bottom elevation was then compared to the predicted future groundwater levels of the specific observation well.

- If the bottom elevation was found higher than the predicted level, the observation well was assumed to become dry by that year.
- The above estimations are regarded as 'best case scenario' because, while mean rainfalls might remain similar to past long term trends, the drafts are expected to increase. As a result, the water table decline rate is expected to increase. However, in this exercise only current average rates were taken.
- The above estimations include only the observation wells used for the current study (RGWD & CGWB). Therefore, the results of predicted levels and dry wells refer only to the monitoring and observation wells.
- Predicted levels and estimation of dry observation wells in the next few decades are given only for CGWB & RGWD monitoring wells as a rough assessment. These assessments should be regarded to as a general index to evaluate the severity of water table depletion in each Agroclimatic Zone.
- The predictions give a general indication for the future expected needs of deepening of existing observation wells and drilling of new ones.

4.5 Groundwater Quality

Four main steps were conducted for all groundwater quality database:

- Pre-processing;
- Data validation;
- Data sorting and creation of time series;
- Graphs and tables preparation.

The pre-processing steps included:

- Groundwater quality data were received in PDF format for the period 1984-2010, containing some 17,500 sheets of data.
- All PDF data sets were converted into EXCEL format, creating one large database with approximately 300,000 entities
- QA was done to confirm that all data were successfully converted.
- Unification of 'location' names in each district was carried out, partly automatically and partially manually.
- Each sample was linked to a well and XY coordinated, using the location and block name.

The data validation was carried out based on the following four main steps:

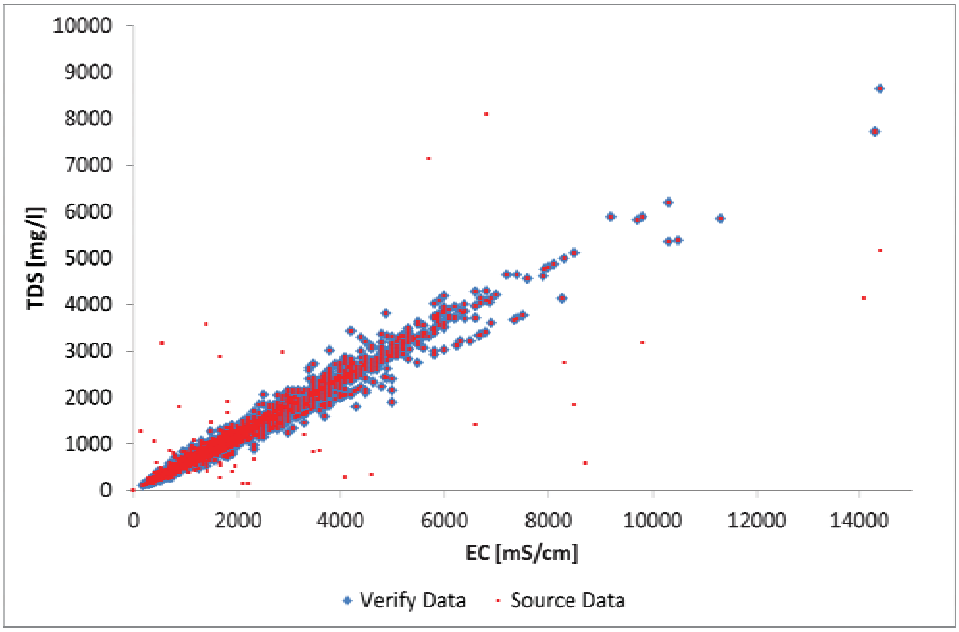
- **Reaction Error**: 'Reaction error' or the 'ion balance charge equation' was used to assess the precision of chemical analysis of a groundwater sample. Natural water should be chemically balanced, and this is commonly validated by dividing the sum of anions and cations by the difference of anion and cations, namely:

$$RE[\%] = 100 \cdot \left| \frac{(Ca^{+2} + Mg^{+2} + Na^{+1} + K^{+1}) - (SO_4^{-2} + Cl^{-1} + NO_3^{+1} + HCO_3^{-1})}{(Ca^{+2} + Mg^{+2} + Na^{+1} + K^{+1}) + (SO_4^{-2} + Cl^{-1} + NO_3^{+1} + HCO_3^{-1})} \right|$$

Usually, RE factor of <5% is considered to be an acceptable result ("Standard Methods for Examination of Water and Wastewater", Chapter 1030E. 21st Edition 2005). Cases in which RE is greater than 5% give evidence of measurement error or contamination. The calculation requires a complete chemical analysis and the availability of all major ions.

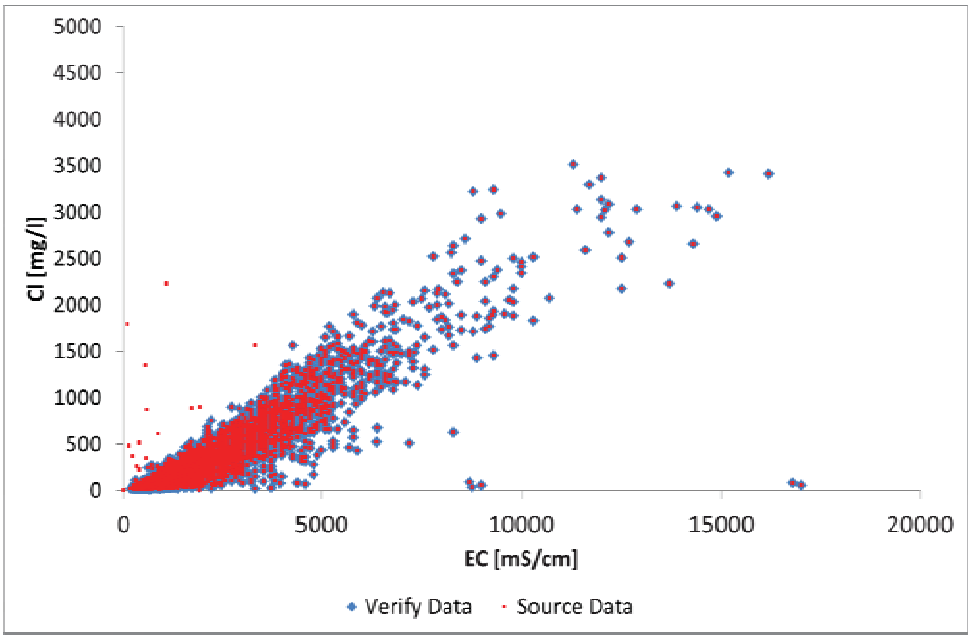
- **TDS vs EC correlation**: TDS and EC are linearly correlated to each other. Graphs of TDS vs EC were produced and the linear regression line was found and examined. Most regression lines presented relatively high accuracy (R^2>0.75). Measurements falling more than 1 standard deviation away from the line were eliminated (Figure. 4.2).

Figure 4.2 Correlation between TDS and EC (Samples from Tonk District)



- **EC vs. Cl correlation**: EC and Cl are also linearly correlated to each other, mainly in the lower range and up to a certain threshold. Results which were more than 1 standard deviation above the regression line, were removed (Figure 4.3).

Figure 4.3 Correlation between Cl and EC (Samples from Tonk District)



- **Extreme values**: For each of the 4 parameters (Cl, F, NO_3, EC) unreasonable extreme low / high values which are not likely to be found in Rajasthan, were eliminated from the database.

4.5.1 Creation of Time Series

- The original database included each measurement in a separate row, creating a long table with no ability to create a time series graph.
- The entire database was re-arranged in a way where each measuring point (well) was linked to a continuous time series with as much as available measurements for each parameter. This enabled plotting a graph for each well for each parameter showing the change in concentration in time.
- The database was then classified according to Agroclimatic Zone, District-wise/block-wise and aquifer unit wise.
- Completion of missing data (blank cells) was carried using linear interpolation.
- Influence radius for each well was calculated using the Thiessen polygon method.

4.5.2 Data Analysis

- Weighted average value per each measurement between 1984 and 2010 was calculated for each parameter in every block of the districts covering the ACZs.
- Datasets were plotted on a graph showing trend lines and rates of change for each parameter.
- The average of the highest 5% values (wells) in the every block of the districts covering the ACZs was calculated and presented on the graph as well as the average of the lowest 5%.

4.6 Ground water Suitability for Agriculture

The suitability of groundwater for agricultural purposes depends on the effect of the mineral constituents of the water on the soil and the plants. There is a relationship between the SAR (Sodium Adsorption Ratio) level in irrigation water and the extent to which sodium is absorbed by the soils. The Sodium Adsorption Ratio (SAR) in irrigation water represents the sodium hazard of water. The sodium adsorption ratio is defined as:

$$SAR = \frac{Na^{+}}{\frac{\sqrt{Ca^{++} + Mg^{++}}}{2}}$$

where the concentration of ions are in equivalents per million (epm).

When SAR lies between 0 and 10, it is called Low Sodium Water (S_1); between 10 and 18 it is called Medium Sodium Water (S_2), between 18 and 26 - High Sodium Water (S_3). As for values of more than 26, it is called Very High Sodium Water (S_4). The suitability of these four kinds of water for irrigation is explained in Table 4.1.

Table 4.1 Groundwater Suitability for Irrigation in respect of SAR Levels

S. No.	Type of Water	Suitability for Irrigation
1	Low Sodium Water (S_1) SAR between 0 to 10	Suitable for irrigation on almost all soils and crops except if they are very sensitive to sodium
2	Medium Sodium Water (S_2) SAR between 10 to 18	Hazardous in fine texture soils and organic soils with good permeability
3	High Sodium Water (S_3) SAR between 18 to 26	Hazardous on all soils and require good drainage
4	Very High Sodium Water (S_4) SAR above 26	Not suitable for irrigation

Source: US Salinity Laboratory

The water quality classification for irrigation water is developed based on criteria given in Table 4.2.

Table 4.2 Groundwater Quality Classification for Irrigation

Water Class	Sodium (Na) %	EC (micromhos/cm)	SAR
Excellent	<20	<250	<10
Good	20-40	250-750	10-18
Medium	40-60	750-2,250	18-26
Bad	>60	>2,250	>26

Source: US Salinity Laboratory

The % sodium (Na %), Electrical Conductivity (micromhos/cm) and SAR value together help classification of areas into various water quality classes for irrigation purpose based on this criteria the classification of irrigation water into various categories is summarised in Table 4.3 given below.

Table 4.3 Classification of irrigation water

S. No.	Class	Characteristics
1	C_1S_1	Low Salinity & Low Sodium
2	C_1S_2	Low Salinity & Medium Sodium
3	C_1S_3	Low Salinity & High Sodium
4	C_1S_4	Low Salinity & Very High Sodium
5	C_2S_1	Medium Salinity & Low Sodium
6	C_2S_2	Medium Salinity & Medium Sodium
7	C_2S_3	Medium Salinity & High Sodium
8	C_2S_4	Medium Salinity & Very High Sodium
9	C_3S_1	High Salinity & Low Sodium
10	C_3S_2	High Salinity & Medium Sodium
11	C_3S_3	High Salinity & High Sodium
12	C_3S_4	High Salinity & Very High Sodium
13	C_4S_1	Very High Salinity & Low Sodium
14	C_4S_2	Very High Salinity & Medium Sodium
15	C_4S_3	Very High Salinity & High Sodium
16	C_4S_4	Very High Salinity & Very High Sodium

4.7 Groundwater Abstraction Village-wise

Data of existing wells (year 2010), village-wise have been collected for use in assessing village-wise groundwater abstraction in ACZs. The procedure for assessment of village wise ground water abstraction is outlined in Annex 5(a) and Annex 5(b) presents the collected data and the village-wise computation of groundwater abstraction in each ACZ. The procedure used include assessment of the potential zone area occupied by various aquifer units in a village, number of tube wells/openwells in operation for 120 days in a year and formation wise average yield in litres per day thereby assessing the total abstraction of ground water.

4.8 Assessment of Dynamic Ground Water Resources

The methodology of village-wise dynamic groundwater resources assessment is based on application of GIS based analysis and adopting GEC (1997) methodology. The ground water resources estimation methodology (GEC'97) which utilises water level fluctuation method is used based as concept of storage change due to differences between input and output components, where input refers to recharge from rainfall and other sources and output refer to ground water drainage and abstraction. The methodology is as below.

- Area of the hills having slope more than 20% was identified as Non-Potential Zones (NPZs) which was intersected with village layer and this area was not included in the assessment.
- Hydrogeological unit layer was intersected with village layer to calculate the village area falling into different hydrogeological units.
- Command area layer was intersected with village layer for identifying command and non command areas by village.
- Saline area layer was intersected with above layers for identifying saline and non-saline areas by village.

- Water level fluctuation data of RGWD and CGWB observation wells for the past 5 year has been used for assessment and employing the interpolation technique in GIS platform (zonal statistics of spatial analyst tools) adopting 25m x 25m grid for the entire area of assessment, village-wise with respective hydrogeological unit.
- Village-wise annual ground water draft considered at the time of assessment for irrigation and domestic (monsoon and non monsoon for the year 2010) based on the village-wise data collected on number of wells in year 2010.
- Recharge considered in the assessment from other sources (Recharge from canals, surface and ground water irrigation and tank and ponds) both for the period of monsoon and non monsoon for the year 2010.
- Similarly, the command area (monsoon and non monsoon recharge from canal) has been considered separately while carrying out the resource assessment.
- Rainfall recharge calculated using Water Level Fluctuation (WLF) method for the monsoon season for year 2010.
- Normalization of rainfall recharge calculated for monsoon season by WLF method has been done by using normal rainfall figures (1957-2010).
- In areas where negative fluctuation (Post monsoon is deeper than Pre monsoon water level) is observed, Rainfall Infiltration method has been used.
- Rainfall recharge calculated using Rainfall Infiltration Factor method both for the monsoon and non monsoon season.
- Percentage of difference calculated to consider the accepted value between normal rainfall recharge (RIF Method) and normal rainfall recharge (WLF Method) for the monsoon season.
- Finally recharge estimation computed village wise by adding (Adopted rainfall recharge and recharge from other sources both for monsoon and non monsoon season).
- Resource assessment carried out separately for the saline areas in GIS environment.

Further details on the procedure for assessment of village wise dynamic ground water resources is outlined in Annex 6(a) and Annex 6(b) presents the village-wise computation of dynamic ground water resources in each ACZ.

4.9 Assessment of Static Ground Water Resources

The static groundwater resources have been estimated by applying the following formula:

Static groundwater resources = effective potential zone area of the aquifer × utilizable saturated thickness × specific yield

Central Groundwater Board has estimated the static groundwater resources block-wise, in each hydrogeological formation in the entire State, in the years 2004 and 2008. Average depth of the basement and utilizable saturated thickness of the different hydrogeological formations have been adopted on the basis of the values as reported by the respective field hydrogeologist of the respective areas and used in the static groundwater assessment, year 2008. The static groundwater resources for the year 2010 have been calculated by adopting same criteria as indicated above.

The various parameters adopted for estimation of static groundwater resources are shown in Table 4.4. Further details can be seen in Annex 7(b).

Table 4.4 Various Parameters adopted for Estimation of Static Groundwater Resources

Parameters	Alluvium	Sandstone	Limestone	Hardrocks
Specific Yield	0.01 - 0.03	0.001 - 0.004	0.0015 - 0.004	0.001 - 0.003
Utilizable Percentage of Saturated Thickness (%)	10 - 40	3 - 35	5 - 35	2 - 35
Average depth of basement (m bgl)	Adopted on the basis of groundwater exploration data			

Source: CGWB & RGWD

The groundwater exploration data is given in Annex 2(a). The details on the procedure adopted for assessment of village wise static ground water resources is outlined in Annex 7(a). The village-wise computation of static ground water resources in each ACZ is presented in Annex 7(b).

5. Geology of Rajasthan

5.1 Introduction

A geological map of Rajasthan prepared by Geological Survey of India is presented in Figure 5.1.

The geological sequence of rock formations of the State is highly varied and complex, revealing the co-existence of the most ancient rocks of pre-cambrian age and the most recent alluvium, as well as wind-blown sands of the Quaternary to Recent age.

A brief geological description of the important geological formations occurring in Rajasthan is discussed in the following paragraphs.

The Archaeans are represented by Bhilwara Supergroup, which consists of high-grade metamorphites and gneisses (Banded Gneissic Complex), together with the associated low-grade metamorphites that represent the oldest metasedimentary sequence.

This super group comprises a complex assemblage of metasemipelite, quartzite, conglomerates, metagraywackes, marble, dolomite, calc-silicate rocks, basic metavolcanics, migmatite, granite, granite-gneiss, granulitic rocks and ultramafics.

Bhilwara Super group has a wide crescent-shaped distribution in eastern Rajasthan, from the south-western border of Bharatpur District to Banswara District. It occupies large areas, mainly in the districts of Sawai Madhopur, Tonk, Ajmer, Bundi, Bhilwara, Udaipur, Chittaurgarh, Pratapgarh and Banswara. In the north, this super group is overlain by Delhi Super group and in the south – by Aravalli Super group.

Granite and gneiss occur over a crescent-shaped area of about 100 km in length and 30 km in width, in central Rajasthan, in the Chittaurgarh and Bhilwara districts. Over a large part of the area the rock is essentially non-porphyric granite, medium grained and varying in colour from reddish pink to greenish yellow.

The geological succession of rock formations in Rajasthan is shown in Table 5.1.

Table 5.1 Geological Succession of Rock Formations in Rajasthan

Geological Time Unit		Lithostratigraphic Period		Lithology
Era	Period	Super group / Group		
Recent				Alluvium and blown sand
Cainozoic (Tertiary)	Eocene	Mandai/ Akli/ Kapurdih/ Jogira/ Banda/ Khuiala / Palana		Sandstone, bentonitic clay and fuller's earth
Deccan Traps				Basalt
	Cretaceous	Abur / Fatehgarh		Sandstone, limestone, clay and lignite
Mesozoic	Jurassic	Parihar/ Bhadesar/ Baisakhi/ Jaisalmer/ Lathi		Limestone, sandstone and shale
	Permo- Carboniferous		Bhadura	Sandstone and boulders
Palaeozoic		Marwar	Nagaur/ Bilara/ Jodhpur	Sandstone, gypsum, siltstone, limestone, dolomite and shale
Upper		Vindhyan	Bhander/ Rewa/ Kaimur/ Semri	Sandstone, shale, limestone, conglomerate and basic flows
Proterozoic		Acid, Basic and Ultrabasic Intrusives and Extrusives		
		Malani Volcanics / Plutonics		
		Kishangarh Syenite		
		Delhi	Ajabgarh/ Alwar/ Sirohi/ Punagarh/ Raialo	Quartzite, schist, gneiss, marble, shale, slate, phyllite and basic flows
Lower		Granite, Basic and Ultrabasic Intrusives		
Proterozoic		Aravalli	Jharol/ Bari/ Udaipur/ Debari	Quartzite, schist, phyllite, conglomerate, greywacke, metavolcanics and marble
		Granite and Basic Intrusives		
Archaean		Bhilwara	Ranthambore/ Rajpura-Dariba /Hindoli	Phyllite, slates, schist, gneiss, granite gneiss and migmatites

Source: GSI

5.2 Aravalli Super Group

The Aravalli Super group consists of a great thickness of phyllites and greywacks, with subordinate quartzite, conglomerates and dolomites intruded by granites and basic and ultrabasic rocks. The Aravalli Super group in Rajasthan has been divided into Debari, Udaipur, Bari and Jharol Groups. The rocks of Aravalli Super group are highly metamorphosed at certain places and occur in Udaipur, Dungarpur, Sirohi, and Banswara Districts. The rocks of this Super group also occur to a small extent in the south-western part of Bhilwara District and southwest of Jaipur and Alwar Districts in the north-east. Minerals of great commercial importance are associated with rocks belonging to the Aravalli Supergroup. The central part of the Aravallis is occupied by a great synclinorium composed of Aravalli and Delhi rocks.

5.3 Delhi Super Group

The rocks of the Delhi Super group occur over a large part of central and north-eastern Rajasthan, and are exposed in the districts of Bharatpur, Alwar, Jaipur, Ajmer, Udaipur, Jhunjhunu, Sikar, Nagaur, Jodhpur, Pali, Sirohi and Jalore. However, their best occurrence is in the main Aravalli hill ranges near Ajmer and in western Mewar. Delhi Super group has been divided into Raialo, Punagah, Sirohi, Alwar and Ajabgarh groups. This Super group predominantly consists of quartzite, biotite schist, calc-schist, calc-gneiss, phyllite and marble, with subordinates conglomerate and chert.

5.4 Vindhyan Super Group

The Delhis were succeeded by the Vindhyans after a time interval marked by a distinct erosional unconformity. The Vindhyans in Rajasthan were deposited in two separate basins on either side of the Aravalli hill range, constituting the main Vindhyan basin in eastern Rajasthan and Trans-Aravalli Vindhyan basin in western Rajasthan.

In the main Vindhyan basin of eastern Rajasthan, especially in south-eastern Mewar, the Vindhyan succession is well developed. The sediments were deposited in a large basin extending from Dhaulpur in the northeast to Nimbhahera and Suket in the southwest. The north-eastern and southwestern outcrops are connected by narrow, disconnected patches extending from Sawai Madhopur to Bundi.

In the south-western part of the Vindhyan basin of eastern Rajasthan the total stratigraphic thickness of Vindhyan Super Group formations is 2,400 m, out of this the lower and upper divisions have 1,000 m and 1,400 m, thickness respectively as per Geological Survey of India (G.S.I.). The Vindhyans have been affected by over-thrusts from the west, resulting in the Great Boundary Fault of about 800 km strike length, with a throw of about 700 m. This has brought the undisturbed Upper Vindhyan against the highly folded pre-Aravallis.

The outcrops of Vindhyan in western Rajasthan are much interrupted by desert sands and alluvium, and consist of about 1,000 m thickness resting on the Malani Rhyolites and Phyllite & Schist of Delhi Super Group. These rocks are grouped into a new Super group called Marwar Super group and are divided into (a) Jodhpur Group, (b) Bilara Group, and c) Nagaur Group, consisting mainly of sandstones, limestones and sandstones, interbedded shale, gypsum and anhydrite respectively. The age of this Super group is Lower Palaeozoic.

Igneous rocks are represented by a variety of rocks, ranging from to acidic to basic and ultra basic rocks.

The Ultra basic rocks are represented by peridotite and pyroxenite, metamorphosed to talc-serpentine-chlorite rocks. These rocks occur in Banswara, Dungarpur, Udaipur, Pali and Ajmer Districts. The ultra basic and basic rocks are intrusive and have been assigned post-Aravalli and post-Delhi ages.

Nepheline-syenite is exposed in the vicinity of Kishangarh town (Ajmer District) and is in the form of sheet-like intrusions into the pre-Aravallis and Banded Gneissic Complex along the margin of the Delhi Supergroup, giving rise to elongated ridges. On the basis of radiometric dating age the nepheline syenites (1,475 m/y) are considered of post-Delhi age.

Erinpura Granite is the principal intrusive into the Delhi Supergroup. It occurs as bosses and sills of all sizes. The outcrops of the Erinpura Granite, isolated at places are found extending from Ajmer and Beawar in the north-east to the main belt of the type area of Erinpura and Mt. Abu in the southwest.

The Malani suite of igneous rocks is represented by the Siwana and Jalore granites, with their acid volcanic representatives known as the Malani Rhyolites, which is composed of felsites and pyroclastic material. The Malani rocks are intrusive into the Delhis and are younger than the Erinpura Granite. The Malani granite shows a marked unconformity with the overlying Trans-Aravalli Vindhyans (Marwar Supergroup) and hence their age may be post-Delhi, and probably younger than Lower Vindhyan.

In western Rajasthan, in Jaisalmer District, a sequence of sediments consisting of two formations – the Rends and the Britannia – occurs over a small area overlying the Malani suite of igneous rocks. On the basis of lithological similarities and their superposition on the Malani igneous rocks this sequence has been considered to be homostadial with the Jodhpur Group and Bhilwara Group and thus considered as representing Cambrian sedimentation in Rajasthan.

The rocks of Mesozoic Era occur in western Rajasthan mainly in Jaisalmer and Barmer Districts. Isolated outcrops are also found at the junction of the borders of Jaisalmer, Jodhpur and Barmer Districts. The Lathi formation of Mesozoic age occupies the maximum area (7,500 km^2) in Barmer District. The lithological units of this era are referred to by different names, as indicated in the stratigraphic succession.

Volcanic activity in the form of fissure eruptions in central and western India marked the close, locally, of the Mesozoic era. In Rajasthan, the northern extensions of Deccan Traps occupy part of south-eastern Mewar and overlie the older formations. The rocks generally show spheroidal weathering and exfoliation, giving rise to rounded boulders.

Outcrops of rocks of Eocene age occur at widely separated areas in Barmer, Bikaner, and Jaisalmer Districts. The relationship is obscure due to the intervening desert sand and alluvium. The litho-units of this era have also been called different names in different locations, as indicated in the stratigraphic succession. The Palana Series, hitherto included in Cretaceous rocks, is now considered to be of Palaeocene age.

Alluvium, blown sand, Kankar and Evaporites are of recent to sub-recent age. Alluvium is fairly thick and widespread in Bharatpur, Sawai Madhopur and parts of Tonk and Jaipur Districts, and also along the valleys of Banas, Banganga, Berach and Chambal rivers. Thick alluvium and blown sand occur in Luni river basin and several other areas in western Rajasthan covering the Thar Desert. The Thar Desert, along with a vast blanket of unconsolidated deposits, covers the region in the west, north-west and

north of Rajasthan. Recent and sub-recent deposits are the most important geological formations in occurrence and possible development of groundwater resources.

Alluvium directly overlies the Pre-Cambrian basement in the central part of the basin where its thickness varies from 242 m in the southern part, around Phulka (29°29':75°08') to 533 m in the northern part around Kheliawala (29°39':73°19').

In Ganganagar and Hanumangarh Districts, the thickness of the alluvium that mostly overlies Palana series, varies from about 130 m in the south to about 400 m in the north.

Concretions and nodules of calcium carbonate, called Kankar, are extensively distributed throughout the vertical column of the alluvium in Ganganagar and Hanumangarh Districts. Kankar encountered towards the bottom of the tubewells drilled at Sri Bijoy Nagar (29°15':73°31'), Dudianwali (29°16':73°52') and Kamharwala (30°19':75°40') occurs as hard pans ranging in colour from greyish brown through yellow to pinkish.

Sand dunes dots occur in Ganganagar District and the intervening depression. Sand dunes consist of silt and very fine sand, brownish yellow to buff in colour coalesced together, and rises in the form of small hillocks, of an average 4 to 5 m height above ground level. The dunes are about 30 m high in the Suratgarh area.

Quaternary alluvial deposits from the main aquifers of Ganganagar District.

Rocks belonging to the Proteriozoic Group are not exposed anywhere in the lower Ghaggar river basin. Delhi quartzite has been encountered at a depth of 533 m at Kheliawala (29°39':73°19') and porphyritic hornblende biotite granite, belonging to Malani suite of igneous rocks, has been encountered at a depth of 240 m at Phulka (29°29':75°08').

The Palaeozoic Group of rocks are also not exposed anywhere in Ganganagar and Hanumangarh Districts. Sandstone resembling Jodhpur Sandstone has been encountered in the boreholes drilled at Ottu (29°30':74°53'), on Rajasthan – Haryana border, at a depth of 206 m. The sandstone is pink in colour and fine to coarse-grained.

6. Hydrogeological Units

The classification of hydrogeologic units is based on hydraulic parameters and the assessed potential of each rock unit. Groundwater analysis for any purpose should differentiate between the various water-bearing formations.

A total of 19 hydrogeological units have been identified on the basis of CGWB and RGWD data base (see Table 6.1). The significant and mapable hydrogeological units are considered to serve the purposes of water resources planning. The hydrogeological units were delineated using water-bearing formation data of CGWB and RGWD. The same have been delineated on micro-watershed, using GIS, and also panchayat samiti-wise (block-wise) and village-wise. Hydrogeological map of Rajasthan state is shown in Figure 6.1.

The various units present a wide array of exploitation potential, quantity-wise as well as quality-wise. While some of the units present similar hydraulic characteristics and groundwater potential, others may exhibit totally different features and qualities. For example, the Sandstone, Limestone and Alluvium units are usually considered to be the better aquifers, whereas the various fractured rock aquifer units usually present poor

hydraulic conditions. As a result, the hard rock aquifers are more extensively developed while successful pumping wells in the fractured rock are rarer.

Table 6.1 Major 19 Hydrogeological Formations with the area covered by each Unit in Rajasthan

S. No.	Hydrogeological Units	Area Km^2
1	Younger Alluvium	48,070.05
2	Older Alluvium	94,968.09
3	Tertiary Sandstone	24,502.65
4	Deccan Traps (Basalt)	9,580.51
5	Jurassic Sandstone (Lathi, Parihar, Baisakhi, Bhadesar)	15,213.07
6	Vindhyan Sandstone (Nagaur, Jodhpur)	25,675.64
7	Bilara Limestone	9,522.51
8	Bhander Sandstone	13,954.29
9	Limestone (Alwar, Bhander, Upper Cretaceous)	4,853.08
10	Shale	3,906.68
11	Quartzite	5,325.02
12	Slate	367.65
13	Phyllite & Schist	35,728.18
14	Gneisses	1,967.40
15	Jalore Granite	5,612.72
16	Erinpura Granite	5,229.75
17	Rhyolite	5,046.40
18	Ultra Basics	107.72
19	Gneisses(B.G.C.)	21,724.31
20	Hills	10,908.08
	Total	**342,263.80**

Source: CGWB and RGWD

The data of exploratory wells/Piezometer boreholes of CGWB/RGWD is at Annex - 2(a).

Hydrogeological characteristics of above 19 aquifer units are given in the Table 6.2.

Broadly, the alluvial aquifers are porous and extensive and sedimentary, crystalline and metamorphic aquifers have dual permeability character determined by weathered zone on top followed by thickness of jointed and fractured zone. The characteristics of 19 hydrogeological units have been tabulated as per data available as on year 2010.

Table 6.2 General Aquifer Characteristics of 19 Hydrogeological Formations

S. No.	Aquifer	Nature of Aquifer	SWL* m, bgl	Yield potential, lps	Transmissivity m^2/d	Specific Yield
A.	**Alluvial Aquifers**					
1	Younger Alluvium	Porous, permeable and have limited occurrence	2.75-26.33	6.10-20.00	-	0.15
2	Older Alluvium	Porous, permeable and have wide occurrence	1.00 to 130	5.00-50.00	13.32-7,944.00	0.1
B.	**Sedimentary Aquifers**					
1	Tertiary Sandstone	Porous, permeable and jointed	30.05-7.06	1.80-9.16	74.00-1,516.00	0.06
2	Bilara Limestone	Cavernous, jointed and fractured	9.10-56.08	6.25-75.70	-	0.07
3	Limestone (Alwar, Bhander, Upper-Cretaceous,)	Occasionally, cavernous, jointed and fractured. Often intercalated with Shale	27	<5.00-15.00	-	0.03
4	Jurassic Sandstone (Lathi, Parihar, Baisakhi, Bhadesar)	Porous, permeable. Intercalated with Shale	6.75-22.56	4.60-64.70	1,161.00-1,883.00	0.06
5	Vindhyan Sandstone (Nagaur, Jodhpur,)	Porous, permeable. Intercalated with Shale	2.06-58.40	0.50-8.00	30.00-1649.00	0.04
6	Bhander Sandstone	Occasionally Porous, Jointed fractured and quartzitic in nature. Often intercalated with Shale	3.11-12.46	1.00-6.00	39.00-1,138.00	0.02
7	Shale	Jointed and Fractured	6.85-41.44	0.60-60.00	55.00-269.9	0.015
C.	**Hard-Rock Aquifers**					
1	Deccan Traps (Basalt)	Occasionally vesicular Jointed and Fractured	1.35-10.54	1.10-8.30	3.00-249.00	0.01
2	Rhyolite	Jointed and Fractured	17.22-9.87	0.10-0.15	-	0.01
3	Jalore Granite	Jointed and Fractured	10.20-9.20	3.00-5.00	-	0.02
4	Erinpura Granite	Jointed and Fractured	38	1.00-16.00	-	0.02
5	Gneisses	Jointed and Fractured	3.41-43.80	5.00-20.00	12.00-305.00	0.015
6	Quartzite	Jointed and Fractured	7.60-80.00	<5.00-6.00	10.00-404.00	0.02
7	Slate	Jointed and Fractured	16.8	0.50-5.50	-	0.02
8	Ultra-Basics	Jointed and Fractured	-	-	-	0.02
9	Phyllite and Schist	Jointed and Fractured	1.10-63.00	0.15-20.00	6.52-115.00	0.02
10	Gneisses (B.G.C.)	Jointed and Fractured	0.43-16.17	0.33-10.00	-	0.015

Source: CGWB and RGWD

* Static Water Level is based on the data from 1963 to 2010.

The yield of wells in alluvial aquifers range for less than 5 to 50 lps. The yield of wells in hard-rock aquifers in general range from 5 to 20 lps except for Bilara limestone and Jurassic sandstone aquifers (Lathi, Parihar etc.) which have maximum yield of 75.70 and 64.70 lps respectively and the maximum yield of wells in Shale aquifer is 60 lps as shown in Table 6.2.

The ground water level data (1984-2010) of observation wells of RGWD/ CGWB ACZ- wise for Rajasthan is at Annex 2(c). Aquifer –wise fluctuation in levels of ground water for 19 aquifer units in the state is shown in Table 6.3.

Table 6.3 Aquifer-wise Ground Water Level Fluctuation in Rajasthan

ACZ	Fluctuation of Ground water level (m)		
	Min	Max	Average
Younger Alluvium	-7.01	10.60	0.81

7. Agro Climatic Zones of Rajasthan

Introduction

Agro Climatic Zones of the state have been defined according to the prevailing climate in each ACZ and the crops grown, irrigation patterns etc. Figure 7.1 shows the ACZs and the river basins of Rajasthan. Figure 7.2 presents the Agro Climatic Zone map of Rajasthan along with districts and block covered in each zone.

A summary of data on rainfall, temperature, relative humidity, evaporation etc. in the various ACZs is presented in Table 7.1.

Table 7.1 Summary of Agroclimatic Zones of Rajasthan

Zone	Name of the Zone	Areakm^2	Districts Covered	Average Annual Rainfall (1957-2010), mm	Temperature, °C		Mean Relative Humidity, %			Mean Annual Evaporation (1990-2009), cm		
					Max.	Min.	Min.	Max.	Mean	Min.	Max.	Mean
Ia	Arid Western Plain	45,577.83	Barmer and part of Jodhpur	270.2	40.00	8.00	43.9	52.3	47.4	206.9	264.4	232.9

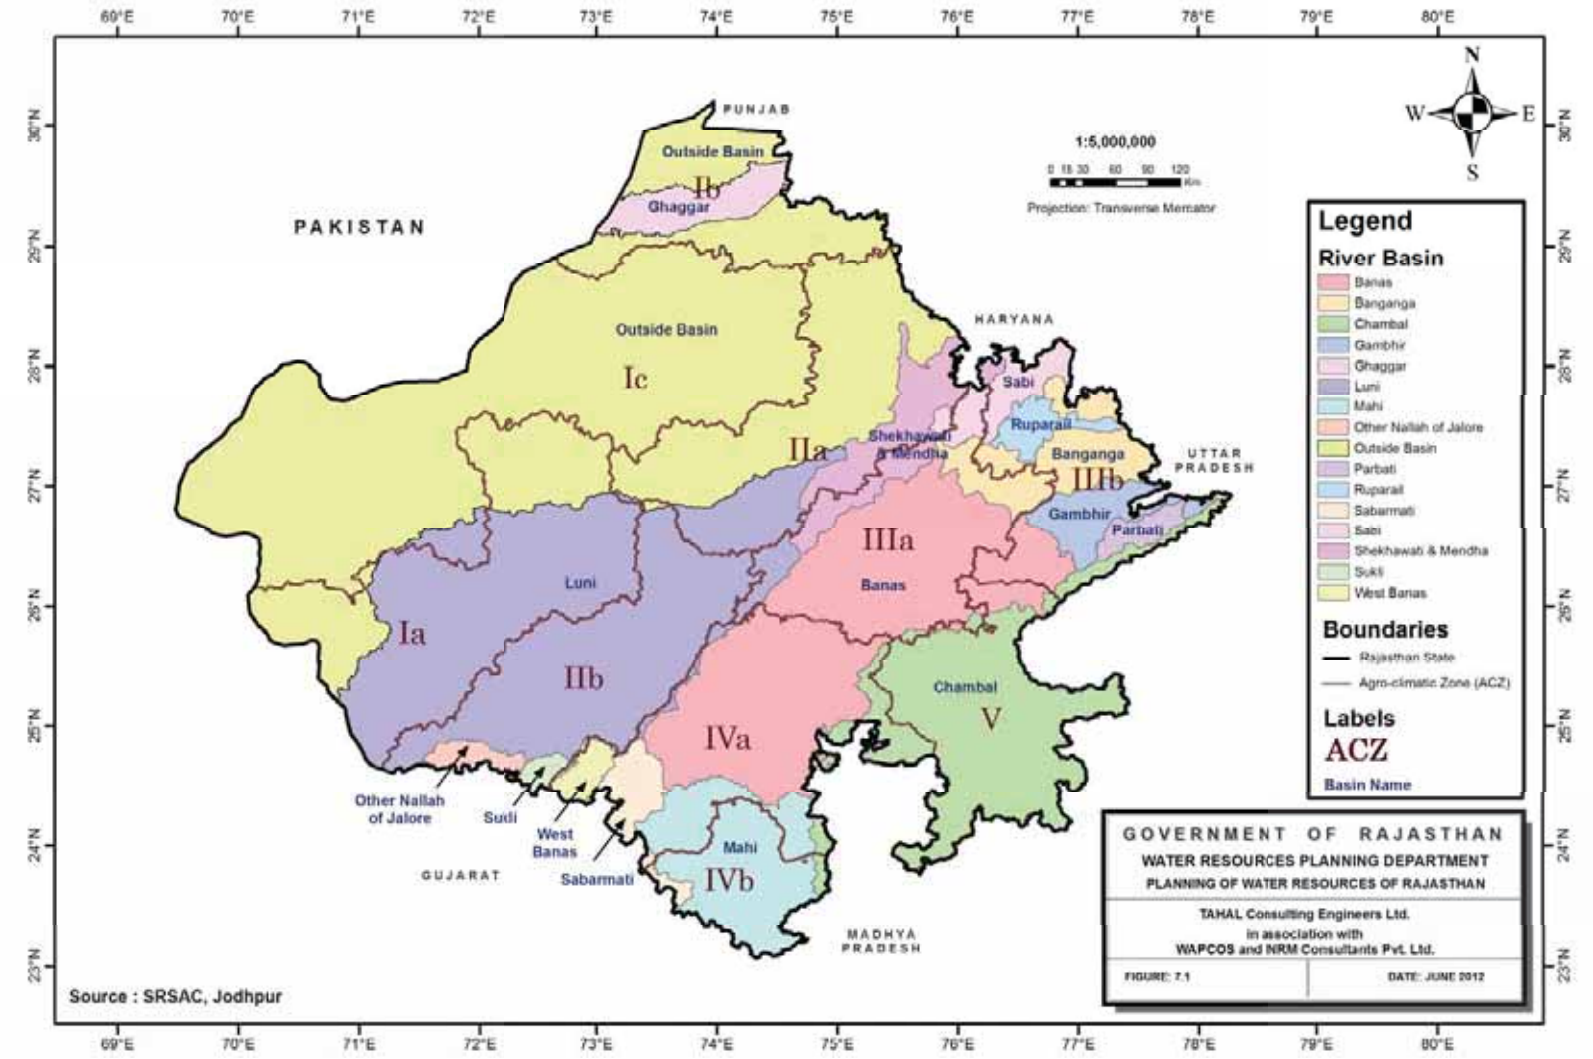
Figure 7.1 Agro Climatic Zones of Rajasthan



7.1 ACZ Ia- Arid Western Plain

This zone covers the entire Barmer District, except Siwana block, and Jodhpur district excluding Bilara and Bhopalgarh blocks. This zone, which covers an area of 45,577.83 km^2, is one of the most arid parts of the State. The annual average rainfall (1957 - 2010) in this zone is 270.20 mm. The zone experienced the lowest rainfall in the year 2002.The minimum rainfall in Barmer District was recorded as 36 mm in the year 2002 at Guda Malani and 39 mm at Luni in Jodhpur District during the year 2002. The area received maximum rainfall during the year 1990. In Barmer District the maximum rainfall was recorded as 1095 mm in Guda Malani and 821 mm in Jodhpur District. Almost 80 – 90% of the total rainfall is received during the southwest monsoon which enters the area during the first week of July and withdraws in mid-September.

The humidity is highest in August (63.25%) with mean daily relative humidity of 43% in Barmer and 81% in Jodhpur region.

The annual maximum potential evapotranspiration in the zone is quite high. It is highest in May (264 mm) and lowest in December (77 mm). Summer temperatures are high and the diurnal range exceeds 20°C. During the day, the summer temperatures are as high as 49°C but at night, the temperature falls to less than 20°C. In winters, the day temperatures are relatively higher, but night temperatures may drop drastically. Winters are of short duration, not exceeding two months during December-January.

This area does not have a developed drainage system. Owing to poor rainfall, surface water resources do not exist, while groundwater is deep and brackish. With the first showers in late July, a few grass species grow and shrubs and dwarf trees become green. But soon after the retreat of the Monsoon in mid September, the vegetation dries up, leaving only a few perennial shrubs and a thin pad of pale grass on the landscape.

Mostly rain-fed crops like bajra, Kharif pulses, guar etc. are grown during the Kharif season. Rabi crops include wheat, rape-seed and mustard.

7.2 ACZ Ib - Irrigated North-Western Plains

This zone has an area of 20,620.77 km^2. The entire area of Ganganagar and Hanumangarh Districts is an alluvial and aeolian plain, formed by Ghaggar River. The Ghaggar channels are quite wide at some places and inundate nearby villages during heavy rainfall in their catchment areas.

The arid part of this region is the northern extension of the Indian Thar Desert, covered with wind-blown sand. Extreme aridity, marked with high summer and low winter temperatures, is its usual climatic characteristic. The annual average rainfall (1957 - 2010) is ~240 mm. A minimum rainfall of 75.5 mm in Hanumangarh area was recorded in 1997 and the maximum, 887 mm, was recorded in 1978 in Bhadra. In Ganganagar District, a minimum rainfall of 59 mm was received during year 1991 at Raisinghnagar, and the maximum rainfall occurred in 1976 at Karanpur. The cold season is from December to February and is followed by summer from March to June. The minimum temperature during winter is recorded as low as -1°C, whereas during the summer it rises to as high as 49°C. Evapotranspiration in the zone is highest in the month of May, 424.7 mm, and lowest - in December, 58.9 mm.

The mean relative humidity is highest in August (63.47%). High-speed winds blow in summer. The area is rich in agricultural production thanks to a well-developed system

of canal irrigation systems. The extensive network of Gang Canal and Bhakra Canal, along with the Indira Gandhi Canal, has made the entire area green and productive.

Due to the abundance of canal water irrigation, this region has today become the granary of Rajasthan. Among the Kharif crops, cotton, sugarcane, guar and pulses are important. In the Rabi season, wheat, mustard, gram, vegetables and fruits are produced. Total production, as well as the productivity level of all the crops are much higher in this zone than in other parts of the State.

7.3 ACZ Ic - Hyper-Arid and Partly Irrigated Western Plain

The geographical area of this zone is 77,001.84 km^2. The areas under the command of Indira Gandhi Canal in Jaisalmer, Bikaner and Churu Districts fall under Agroclimatic Zone Ic.

This is among the most arid parts of the State. Annual average rainfall (1957 - 2010) is ~281.40 mm. The minimum rainfall of 9 mm was received in this zone in 2002 in Ramgarh in Jaisalmer District, while a maximum of ~1058 mm occurred during 1977 in Sujangarh District. Humidity is highest in August, with mean daily relative humidity of 71%. Rainfall may not only vary from year to year but fluctuates in the same year too. Summer temperatures may range between 40 and 42°C during June; temperatures may fall to less than 6°C - 8°C during January. However, minimum temperature as low as 1°C during the winter season and a maximum temperature as high as 49°C during summer season, have also been recorded. The mean relative humidity is highest in August (61.62%). Mean annual potential evapotranspiration range between 160 and 200 mm. The duration of winter is generally short, mostly occurring during the months of December and January. Because of low rainfall, local surface water resources do not exist. Groundwater is generally deep and brackish. Natural vegetation is generally seasonal. A few grass species come up with the onset of Monsoon but dry up by mid September. Rainfed crops, like bajra, guar, Kharif, pulses etc., are generally raised. However, with the availability of canal irrigation water and fresh groundwater from losses along the canal, crops raised include cotton, maize groundnut etc. in Kharif, and wheat, mustard, barley, coriander, taramera and cumin in the Rabi season.

7.4 ACZ IIa - Transitional Plain of Inland Drainage

The geographical area of this zone is 37,054.95 km^2. The zone has a semi-arid to arid type of climatic conditions. This zone comprises Nagaur, Sikar and Jhunjhunun Districts and Taranagar, Rajgarh, Churu Blocks of Churu District. Annual average rainfall (1957 - 2010) in this zone is ~439.40 mm. The minimum annual rainfall was 77 mm during year 2002, recorded in Ladnu, and the annual maximum rainfall of 1,242 mm occurred during 1977 in Khetri. The area has extreme temperature conditions with the minimum reaching sub-zero during the winter and a maximum as high as 49°C during the summer. The mean relative humidity is highest in August (66.12%). The annual maximum potential evapotranspiration in the area is quite high. It is highest (255 mm) in May and lowest (76.5 mm) in December. The areas are covered with sand dunes and inter-dunal sandy plains. Drainage is not well developed and streams, which flow in the rainy season, disappear in the sandy areas after covering some distance. Climatically, this zone is slightly better compared to the adjoining zone of the Arid Western Plain. Rainfall is slightly higher, temperatures in summer months do go very high but the winters are very cold. Irrigation is restricted to areas with good groundwater potential.

Bajra, sesamum and kharif pulses are the main crops of the rainy season. Wheat, barley, mustard and gram are grown as irrigated crops or on conserved soil moisture during Rabi.

7.5 ACZ IIb - Transitional Plain of Luni Basin

The geographical area of this zone is 31,656.93 km^2. This area lies between the Aravalli range and the western arid region. The region encompasses the entire districts of Jalore and Pali, Reodhar and Sheoganj Tehsils of Sirohi District, and Bilara and Bhopalgarh Tehsils of Jodhpur District. The region has a semi-arid type of climate. Annual average rainfall (1957 – 2010) in this zone is 412.20 mm. The minimum annual rainfall of 28.4 mm was received during year 1987 in Sanchore, and the maximum of 1,710 mm - in 1971 in Desuri (Pali). The minimum temperature during the winter season touches 2°C, and the maximum of 48°C - during the summer. The mean relative humidity is highest in August (~73%). The annual maximum potential evapotranspiration is highest in May (~265 mm) and lowest in December (~77 mm).

The area is drained by river Luni, which is seasonal and flows only during the rainy season. A number of paleo-channels also exist in this area. The western part of the zone is dotted with sand dunes, interspersed with alluvial soil. Luni and its several tributaries, like Sukri, Mithri and Jawai, have made this area productive. The climatic conditions are almost the same as in the western arid region, except that the rainfall is slightly higher. Groundwater level in these river basins is high, and has been usefully tapped for irrigation. Vegetation is xerophytic and sparse in the western part, but in the east and on the slopes of the Aravalli ranges there is mesophytic vegetation in the form of woodlands, open forests and grasslands.

The area produces bajra, maize, guar, sesamum and pulses in the Kharif season. In the Rabi season, wheat, barley and mustard are the dominant crops, especially in irrigated areas.

7.6 ACZ IIIa - Semi-arid Eastern Plain

The geographical area of this zone is 29,512.93 km^2. This region comprises four districts, namely Jaipur, Dausa, Tonk and Ajmer. River Banas, with its several tributaries, forms a rich fertile plain. On the western side, the region is flanked by the low Aravalli hills which extend from southwest to the northeast.

Annual average rainfall (1957 - 2010) in this zone is ~518.70 mm. The minimum rainfall of 21 mm was recorded during the year 1981 in Sikari, and the maximum of 1,652 mm - also in Sikari in 1995. The annual potential evapotranspiration in the zone is about 1,745 mm. The mean relative humidity is highest in August (67.4%) and lowest in April (29.4%). Summer and winter temperatures are not as extreme as in the arid west. Summer temperatures may reach around 47°C, and in winter the minimum may reach 5°C. Depth to groundwater table varies from 15 to 25 m, but the annual fluctuations are high, especially in the years when the southwest monsoon fails and the yearly replenishment is low. Surface water sources are scarce and thus harnessing of groundwater has been going on at an accelerated pace. Natural vegetation is of the mixed xerophytic and mesophytic type, but owing to heavy felling of trees, the surface mantle has been robbed of its natural wealth. In the total gross cultivated area of this zone, bajra, sorghum and pulses are grown in the Kharif season, and wheat, barley, gram and mustard in the Rabi season. Productivity of all crops in this zone is better than that of the agroclimatic zones to the west of the Aravalli range.

7.7 ACZ IIIb - Flood-Prone Eastern Plains

The geographical area of this zone is 24,431.80 km^2. It comprises Alwar, Bharatpur, Dhaulpur and Karauli Districts and Bonli, Bamanwas and Gangapur city blocks of Sawai Madhopur District. Except for few low hills which exist in Alwar and Sawai Madhopur Districts, the entire region is a flood plain of Banganga and Gambhir rivers. The region has rich alluvial soils, the fertility of which is replenished every year by the flood water of the rivers. In periods of heavy rainfall, the rivers overflow their banks and inundate the surrounding villages.

Climatically, the area is similar to the plains of Banas, but the rainfall is higher in the eastern side. Annual average rainfall (1957 - 2010) in this zone is 611 mm. The minimum annual rainfall of 97 mm was recorded in Bonli (Sawai Madhopur) during the year 2002, and the maximum of 1,727 mm – in Bamanwas (Sawai Madhopur) during the year 1981. The annual potential evapotranspiration in the area is about 1780 mm. The mean relative humidity is highest in August (76%). Natural vegetation exists on mountain slopes, wetland areas and protected zones, but the excessive plundering of forest wealth has dwindled the natural cover. The region produces a variety of crops because both surface water and groundwater irrigation sources exist. A network of canals, extending from the upper Yamuna Canal and the Panchana Dam, irrigate this area. Groundwater depths vary from 5 to 15 m in this zone, and well-water irrigation is practised. The region produces bajra, sorghum, maize, sugarcane, sesamum and a variety of pulses in Kharif season. Wheat, barley, gram and mustard are the dominant crops of the Rabi season.

7.8 ACZ IVa - Sub-humid Southern Plains and the Aravalli Hills

The geographical area of this zone is 37,563.35 km^2. It comprises Udaipur, Bhilwara, Chittorgarh and Rajsamand Districts and Pindwara, Abu road Tehsils of Sirohi District, Pratapgarh, Choti Sadri Tehsils of Pratapgarh District. For the most part, this is a region of low Aravalli hills with an inter-mountain plateau, deeply dissected by streams and rivers. The region has a moderately warm climate in summers and mild winters. Annual average rainfall (1957 - 2010) in this zone is ~615 mm. The minimum annual rainfall of 51 mm was recorded during the year 2008 in Pindwara, and the maximum – 2,263.2 mm - in 1973 in Nimbahera (Chittorgarh).

Humidity is highest in August (~81%). The annual potential evapotranspiration in this area is about 1,495 mm and is highest in May (228 mm). There are a number of surface-water streams like Gambhir, Sabarmati, Banas and its tributaries, but they are all ephemeral. The surface rocks are granitic and highly metamorphosed, and the depressions on the surface are filled with rain-water in the form of natural storages ("tanks").

The area is rich in natural vegetation, which grows on the slopes of the Aravallis and in the wetland areas, but excessive felling of trees has degraded these open forests. Tank water irrigation is most common. The area produces maize as the chief food crop of the Kharif season, but in the irrigated areas rice is also grown. In the Rabi season, wheat, gram and oil seeds are the main crops. In areas of black soil, cotton and opium are cultivated.

7.9 ACZ IVb - Humid Southern Plains

The geographic area of this zone is about 11,979.32 km^2. The districts of Dungarpur and Banswara, parts of Udaipur (Dhariyawad, Salumber and Sarada Tehsils) and Chittorgarh (Choti Sadri, Bari Sadri, Pratapgarh and Arnod Tehsils), are included in this zone. The area comprises low Aravalli hills with intrusions of black lava rocks. This is mostly a tribal area where Bhils, Garasiyas and Damors live amidst forests and hills. The area has a humid climate with an average rainfall of more than 818 mm per year. Annual average rainfall (1957 - 2010) in this zone is 782.80 mm. The minimum annual rainfall, 115.7 mm, was received during the year 1971 in Ganeshpura (Dungarpur District) and the maximum of 2,591 mm was recorded during the year 2006 in Banswara. Temperatures do not fluctuate much in summer and winter, so the area has mild winters and mild summers. The mean relative humidity is highest in August (~82%). All these factors combined promote a profuse growth of natural vegetation. The mountain slopes have an abundance of natural forests.

There are a number of surface-water streams. Mahi and its tributaries, like Anas, Arau and Jakham, have made this area very fertile. The commissioning of Mahi Bajaj Sagar multipurpose project has provided this area with canal water irrigation and electric power. Cotton and sugarcane are the chief cash crops grown in the black soil region. Maize, sorghum and rice are the chief food crops of the Kharif season and groundnut, mustard, sesamum and rapeseed are also grown.

7.10 ACZ V - Humid South-Eastern Plains

The geographical area of the zone is 26,864.08 km^2. Popularly known as the Hadauti Plateau, this region includes the districts of Kota, Baran, Bundi and Jhalawar and two Tehsils of Sawai Madhopur, namely Khandar and Sawai Madhopur. The black soil region of this plateau is fertile and is used for cultivation of sugarcane, cotton and opium. The region has low hills of the Gwalior series, interspersed with broad plateaus of Vindhyan rocks. A large number of rivers drain this area. Chambal is the main river, along with its main tributaries, like Parvati, Kali Sindh, Parwan and Banas. The development of a canal irrigation system with a series of dams and barrages on Chambal River has made this area rich in agricultural production. Gandhi Sagar, Rana Pratap Sagar and Jawahar Sagar dams, together with Kota Barrage, have generated enough resources of electricity and canal water for irrigation. Annual average rainfall (1957-2010) in this zone is 773.40 mm.

The region has warm summers but mild winters. Summer temperatures sometimes touch 45°C. The relative humidity is generally high in this zone. Annual Average rainfall (1957 - 2010) in this zone is 759 mm. The minimum annual rainfall of 54.3 mm was recorded during the year 1979 in Asnawar (Jhalawar district) whereas maximum annual rainfall 2,241.30 mm during the year 1998 was received in Dug (Jhalawar district). The annual normal rainfall varies from 650 to 1,000 mm. The mean annual relative humidity is highest in August (75.84%). Natural vegetation exists in the form of woodlands, parklands and open forests, which have, however, now degraded. Rice and sorghum are the chief food crops grown in the Kharif season. This area is suitable for soyabean and wheat, Barley, gram and mustard are also grown in winter.

8. Groundwater Study in Agro Climatic Zones of Rajasthan

The entire state has been classified into 10 Agro Climatic Zones on the basis of climatic factor existing in a particular zone area. Groundwater study in these ACZs has been conducted on the basis of different parameters and different aquifer units which are discussed in the following paragraphs alongwith the findings of this study. Detailed groundwater study of each ACZ is presented in Volume 2 of this report. As mentioned earlier, 19 main hydrogeological units (aquifer units) have been identified in Rajasthan, the distribution of these 19 aquifer units in 10 Agro climatic zones of Rajasthan is given in Table 8.1.

Table 8.1 ACZ wise Aquifer Units and their Areas

ACZ	Hydrogeological Unit / Hill	Area, km^2
Ia	Younger Alluvium	2,539.65
	Older Alluvium	14,473.69
	Tertiary Sandstone	6,420.44
	Jurassic Sandstone	2,209.81

8.1 Depth to Groundwater

Figures 8.1 and 8.2 present the depth to groundwater levels during pre-monsoon and post monsoon in the year 2010, respectively (based on data given in Annex 2(c)). Depth to groundwater maps should be regarded to with caution as they are affected both from the absolute groundwater elevation and surface topography. Therefore, these maps only represent the existing depth to water level with respect to ground level and should serve as a supplementary tool for planning new well fields and studying groundwater pollution processes. The depth to groundwater seems very different between the two sides of the Aravali Hill Range. On the north-western side, the depth ranges from a few meters bgl to >120 m in some areas presenting relatively large spatial variation. On the south-eastern side, maximum depth reaches 40-60 m (with few localized exceptions of 80-100 m. The depth to water table is directly correlated to seasonal fluctuations (between pre and post monsoon). It is clearly visible that these groundwater fluctuations are negligible in the deeper aquifers. Correlation can be found between Chloride & Electrical Conductivity and the depth to groundwater (groundwater quality, para 1.12.3 in each ACZ). The deeper most groundwater generally present lower salinities compared to areas with shallow water table *e.g.* Osian, Bap and Phalodi blocks of Jodhpur district, Dungargarh and Nokha blocks of Bikaner district, Jaisalmer, Sankara and eastern part of Sam blocks of Jaisalmer district and Nagaur and Mundwa blocks of Nagaur district, Most likely it is related to dispersion and retardation caused by soil-water interactions and transport processes through the unsaturated profile.

8.2 Groundwater Levels and Flow Directions

Figure 8.3 presents the static groundwater elevation contour map for the entire state according to RGWD and CGWB water level data of pre monsoon 2010 (see Annex 2(c)).

Rajasthan is divided by the Aravalli mountain range into two main drainage systems: a western basin, with drainage direction to the northwest, and an eastern basin with a general drainage direction towards southeast. Highest (reported!) groundwater levels are found along the southern stretch of the Aravallies, about 950 – 1000 m amsl, and lowest ones are reported from the southwest, at the outlet of the Luni river into the Rann of Kutchch, in Gujarat, less than 20m amsl. In the east, at the outlets of the different basins from Rajasthan, the water levels are between 100m and 150m amsl. The groundwater level contours along the southern stretch of the Aravallies portray a very complicated, steep pattern in the eastern flank, mainly in the south within ACZ Iva, IV b and V (Banas, Sabarmati and Mahi basins). In the west there is a sharp drop from the 900 – 1000m amsl water level peaks to 300 – 350m amsl levels over a very short lap, with no data (no observation wells) in between (Figure 6.1).

The complex features of the river basins east of the Aravallies are clearly different from those of the western side. The eastern side is subdivided into two huge basins (Banas, Chambal) and eight, small river basins. The main aquifers in these basin areas are the Old and Younger Alluvium overlying semi pervious to almost impervious aquifers. The depth of water level here is shallow and the alluvial aquifers intercept the other water bearing horizons and, therefore, at present there is no necessity of deep well drilling. The western system comprises two huge basins, the Luni Basin and the Outside Basin, where the main aquifers are under a thick cover of alluvium *viz.* the limestone, sandstone and hard-rock formations. The water level is considerably deeper as compared to the eastern part, amounting to more than 100m in the south west (ACZ Ia and Ic). These aquifers also constitute the main potential groundwater resources, although the quality is usually poor, as compared to the eastern basins. However, in the center of the Luni Basin (ACZ IIb) and in the northern part of the Outside Basin (ACZ Ia, Ib), including the Ghaggar Basin, the operative aquifers are younger and older alluvium.

The lateral outlets of groundwater flows from Rajasthan, as is being portrayed in the map, takes place all around the state. In the east there is outflow to the states of Uttar Pradesh and Haryana in the north, to Pakistan in the west and to the state of Gujarat in the south. The IGNP feeder canal contributes to the groundwater resources in the northwest, which is probably more than the groundwater losses to Pakistan.

8.3 Groundwater Level Fluctuation

Figure 8.4 presents the average groundwater fluctuation (post monsoon – pre monsoon) for the period 1984-2010 (data given in Annex 2(c)). Groundwater fluctuation ranges between < 1m and >10 m. These fluctuations are controlled by three main factors: precipitation, nature of hydrogeological formations and the depth to groundwater level. The first and most dominant factor is the monsoon rainfall. . Accordingly, on the northwestern side of the Aravali Range there are low amplitude fluctuations due to the desert conditions (low rainfall, high evaporation, and relatively thick unsaturated zone. On the contrary, the southeastern part of the state is characterized by significant monsoon rains that are reflected in the groundwater fluctuations. The highest fluctuations are recorded in the south within Chittorgarh District (ACZ IVa), probably due to presence of hard rock formations, and secondary porosity (joints and fractures) in them, low storativity, low yield potential and relatively shallow water table.

8.4 Long-Term Water Level Trends

Figures 8.5 and 8.6 present the long term trends (pre-monsoon and post-monsoon respectively) of groundwater levels for the period 1984-2010 (based on data given in Annex 2(c)). The Long-term trends range from rising levels of>0.4 m/yr to a decline rate of more than-1 m/yr. The groundwater level trends reflect the over-all balance of the water in the aquifer. If the total of outflow is greater than the total of inflow – groundwater levels will decline. Therefore, water table trends are one of the best indicators for assessing the over-all condition of the aquifer, taking into account all factors, natural as well as artificial. The maps show a good correlation between the areas characterized by severe water table decline and areas of intensive drafts (see map: Annual average drafts 1995-2009), usually from alluvial formations. According to Figures 8.5, 8.6 three major strips in a general southwest to northeast direction can be identified on the basis of rate of decline of water table / year:

(i) **Southern strip:** moderate decline rates of the water table of up to 0.5 m/yr.

This strip includes ACZ IVa, IVb, V and the northern parts of ACZ IIIa and IIIb. The region is characterized by relatively shallow groundwater and moderate to high annual draft, which are compensated by relatively high rainfall.

(ii) **Middle strip:** extreme decline rates of the water table up to 1 m/yr and above. This strip includes the northern parts of ACZ IIIa and IIIb and ACZ Ia, IIa and IIb. This region, along the Aravali hill range includes some of the most populated districts and increased agricultural activity. Water consumption is the highest in this part of the state with average annual draft volumes of ~ 100 Mm^3 and above. As a result, this is the area having the highest rate of water table decline.

(iii) **Northern strip:** stable levels to moderate increase in groundwater levels up to 0.4 m/yr.

This strip includes mainly ACZ Ia and Ic. Being the desert area habitations in this region are scarce and lower agricultural activity, therefore groundwater abstractions are relatively low, especially in relation to surface area (Mm^3/Km^2). Significant losses of water from the Indira Gandhi Canal into the groundwater causes general increase in the water table along most of this strip (although average rainfall in this area is low).

8.5 Long-Term Drafts

Figures 8.7, 8.8 and 8.9 present the (a) average annual drafts (b) the average annual draft per unit area and (c) the relative change in drafts between 1995 and 2009, respectively on the basis of groundwater assessment reports of 1995, 2001, 2004, 2007 and 2009 of CGWB and RGWD (section 1.12 in each ACZ).

Relative growth between 1995 and 2009 according to uses (agricultural or domestic and industrial) was calculated using the following formula (Example calculation for 1995 to 2001):

$$Relative\ Growth\ [\%] = 100 * \frac{Draft(2001)_{Mm^3} - Draft(1995)_{Mm^3}}{Draft\ (1995) Mm^3}$$

District and block wise groundwater draft for the period 1995-2009 along with the rise and decline in Mm^3/yr in this period and the ratio of average draft v/s per unit block area is given in Annex 8. Average draft per unit area ranges from less than 0.015 $Mm^3/yr/km^2$ to more than 0.21 $Mm^3/yr/km^2$. Highest drafts were recorded mainly in the eastern part of the state in Amber, Jhotwara and Sanganer blocks in Jaipur districts and in Behror, Mandawar, Kotkasim and Tijara blocks of Alwar districts. These are thickly populated areas. These intensive drafts are also reflected in Figures 8.5-8.6 of long-term groundwater level trends. Since 1995 the drafts have increased significantly in most of the state's area (Figure 8.9). Although ACZ Ic presents consistently the highest rise of more than 250%. The draft to area ratio map (Figure 8.8) reveals that the intensity of the pumping in the western part is rather low compared to the eastern part of the state.

8.6 Groundwater Quality

Figures 8.10, 8.11, 8.12 and 8.13 present the distribution of Cl, EC, NO_3 and F in the State of Rajasthan in per-monsoon 2010, respectively (based on data given in Annex 3(a)). Chloride concentrations range from more than 1,000 mg/l to less than 250 mg/l; Electrical Conductivity levels range from less than 750 µS/cm to more than 5,000 µS/cm; Nitrate values range from less than 45 mg/l to more than 100 mg/l and Fluoride concentration range from less than 1 mg/l to more than 1.5 mg/l. In most areas, there is a direct correlation between the chloride concentrations and EC levels. At certain places, high Nitrate levels are associated with high chlorides or EC levels, as a result of agriculture and domestic activities (exhibited in Figure 8.10-8.12). Interestingly, the depth to water table maps present a generally good correlation to the Cl, EC and NO_3 distribution, demonstrating the important role of the unsaturated profile as a buffer zone between the surface and the aquifer reservoir helping to prevent groundwater pollution. As mention above, the deeper groundwater surface presents generally better qualities than shallower areas. Areas with intensive flood irrigation and large evaporation may suffer from increasing Chloride concentration *e.g.* in Barmer, Pali and southern Jodhpur District. In the northern part of the state, IGNP transfers water of higher salinities (partially due to evaporation) to the underlying aquifers. The water recharges the aquifer and raises its salinities as indicated in the maps. ACZ wise and aquifer wise analysis of groundwater quality has been presented in Volume 2 of this report.

8.6.1 Ground Water Quality- Village-Wise

Time-series of hydrochemical data of ACZs, pre and post-monsoon hydrochemical data of ACZs and computed SAR value of ACZ well waters is shown in Annex 3 (a) and 3 (b). By using groundwater quality map layers and superimposing village layer data, the position of the quality of groundwater in various villages in different ACZs was assessed in GIS coverage. The water quality was classified according to the main parameters of chloride, fluoride, nitrate and electric conductivity.

Village wise Suitability of Ground water

Village wise suitability of ground water has been worked out using permissible limits all the 4 parameters as shown in Table 8.2(a) and Table 8.2(b).

Table 8.2(a) Groundwater Suitability Norms for Drinking Purpose

S. No	Chemical Parameters	Maximum Permissible limit in the absence of alternate source
1.	Chloride (mg/l)	1000
2.	Fluoride (mg/l)	1.5
3.	Nitrate (mg/l)	100
4.	Electric Conductivity (µS/cm)	2250

Source: BIS

Table 8.2(b) Groundwater Suitability Norms for Livestock and Poultry

EC, µS/cm	Suitability range of water for livestock and poultry
1500	Relatively low level of salinity. Excellent for all classes of livestock and poultry.
1500-5000	Very satisfactory for all classes of livestock and poultry. May cause temporary and mild diarrhea in livestock not accustomed to them; may cause watery droppings in poultry.
5000-8000	Satisfactory for livestock, but may cause temporary diarrhea or be refused at first by animals not accustomed to them.
8000-11000	Can be used with reasonable safety for dairy and beef cattle, sheep, swine, and horses. Avoid use for pregnant or lactating animals. Not acceptable for poultry.
11000-16000	Unfit for poultry and probably for swine. Considerable risk in using for pregnant or lactating cows, horses or sheep, or for the young of these species. In general, use should be avoided although older ruminants, horses, poultry, and swine may subsist on them under certain conditions.
11000-16000	Risks with these highly saline waters are so great that they cannot be recommended for use under any condition.

Source: Groundwater chemical analysis data pre-monsoon 2010 of CGWB and RGWD.

According to this table, out of total number of 41,704 villages (as per census 2001) in various ACZs, 21,041 have been found suitable for drinking water, 26,191 for irrigation use and 36,827 for livestock/poultry water use. This is discussed ACZ wise in subsequent chapters.

8.7 Static Groundwater Storage

The static groundwater storage is a term referring to the saturated zone of the aquifer which is not renewable. It is located below the zone of the average annual fluctuation (the replenished zone). This is a unique storage. Each cubic meter of water which is drawn out of the static reserve is regarded as permanent loss of this natural resource. The most important and basic principal in exploitation of natural resources, especially the groundwater, is sustainability, *i.e.* using the resource within the limits of the natural replenishment/restoration rate, in order to stop exhaust of this resource. The main danger in utilizing the static groundwater reserve is by causing a permanent change which will affect the groundwater regime (i.e. groundwater levels, flow direction, qualities). The effect of this is dangerous especially in places where fresh-saline interface/transition zones are known. In such cases saline water bodies might intrude into fresh groundwater zone as a result of over pumping in fresh water zone. This might cause salinization of entire well field. Therefore, exploitation of the static storage, if unavoidable, should be carried out with great care and close monitoring. The correct practice should be modelling the expected effects on the groundwater regime at various pumping schemes prior to initiation of the static storage exploitation in order to avoid undesired conditions and irreversible damage.

Figures 8.14 and 8.15 present the static groundwater storage of the fresh and saline (EC > 2,250 µS/cm) aquifers in Rajasthan. The detailed village wise assessment procedure and calculations are given in Annex 7(a) and 7(b), respectively. Block wise details of static ground water storage for fresh and saline (EC > 2,250 µS/cm) aquifer in various ACZs is given in Table 8.4. The amount of groundwater stored in an aquifer depends mainly on its hydrogeological features, on ancient sources of water and on the current water loses (mainly due to massive production). Static Groundwater Storage of fresh aquifers in Rajasthan ranges between almost nothing and reaches more than 200 Mm^3/block. As per the Figure 8.14, areas south to the Aravali Range have relatively limited static storage upto 50.00 Mm^3 (ACZ IVa, IVb, V). This is due to the relatively limited thickness of the Older and Younger Alluvium and the presence of hard rock

formations having low transmissivity. Towards north-west of the Aravali Range there is a larger quantity of static storage because of greater depth of the alluvial formations combined with massive recharge from IGNP and less intensive drafts. Static storage of saline groundwater is found mainly on the northern parts of Rajasthan (ACZ Ia, Ib, Ic) and ranges between less than 50 Mm^3/block and more than 200 Mm^3/block as can be seen in Figure 8.15.

The maximum fresh static groundwater storage of 15,559.51 Mm^3 has been assessed in Older Alluvium aquifer; followed by Younger Alluvium (6803.72 Mm^3), Tertiary Sandstone (3147.68 Mm^3), Vindhyan Sandstone (2773.33 Mm^3), Jurassic Sandstone (2534.66 Mm^3), Bilara Limestone (1133.13 Mm^3), Phyllite & Schist (193.40 Mm^3), Bhander Sandstone (188.61 Mm^3), Gneisses (B.G.C.) (140.28 Mm^3), Jalore Granite (104.12 Mm^3), Limestone (103.15 Mm^3), Rhyolite (68.08 Mm^3), Shale (56.53 Mm^3), Deccan Traps (51.02 Mm^3), Quartzite (27.21 Mm^3), Erinpura Granite (19.69 Mm^3), Gneisses (8.24 Mm^3), Slate (1.43 Mm^3) and Ultra Basics (0.37 Mm^3).

The maximum saline static groundwater storage of 9726.57 Mm3 has been assessed in Younger Alluvium aquifer; followed by Older Alluvium (9429.88 Mm^3), Tertiary Sandstone (6055.38 Mm^3), Jurassic Sandstone (3615.32 Mm^3), Vindhyan Sandstone (692.03 Mm^3), Bilara Limestone (93.08 Mm^3), Jalore Granite (44.28 Mm^3), Rhyolite (28.51 Mm^3), Phyllite & Schist (17.84 Mm^3), Bhander Sandstone (7.08 Mm^3), Erinpura Granite (6.25 Mm^3), Gneisses (B.G.C.) (4.47 Mm^3), Gneisses (3.13 Mm^3), Quartzite (1.19 Mm^3), Limestone (0.49 Mm^3) and Slate (0.01 Mm^3); while Deccan Traps, Shale and Ultra Basics aquifers does not contain any saline area.

Further Agro Climatic Zone wise details are presented in Volume 2 of this report.

Note: Zero resources means negligible value.

8.8 Dynamic Groundwater Resources

Figures 8.16 and 8.17 present the dynamic groundwater availability for fresh and saline (EC > 2,250 µS/cm) aquifers, respectively as per Consultant's assessment for year 2010. The detailed village-wise assessment procedure and calculations are given in Annex 6(a) and 6(b), respectively. Block-wise details of dynamic ground water availability for fresh and saline aquifers in various ACZs is given in Table 8.5. Dynamic Groundwater availability depends on both natural resources such as the amount of rain and recharge from surface water resources such as irrigation projects like the IGNP in western Rajasthan and return flow from irrigated fields. As per Figure 8.16 the fresh dynamic groundwater availability in the entire state ranges from less than 20 Mm^3 to more than 120 Mm^3/yr/block. The dynamic availability of saline groundwater ranges from less then 20 Mm^3 to more than 180 Mm^3/yr/block in the entire state. The dynamic availability of fresh groundwater in Figure 8.16 does not exhibit any definite pattern and show wide variations from area to area. Lower reserves up to 40 Mm^3 are seen in Churu, Ganganagar, Hanumangarh, Pali, Udaipur, Rajsamand, Barmer, Jaisalmer and Chittaurgarh district areas, whereas higher reserves 100 to 120 are available in Kota and Bundi district areas. Both saline and fresh reserves are available in most of the blocks in Western part of the state as such there is possibility of saline water intrusion in to fresh water zone as a result of over exploitation which might effect the location and position of the fresh - saline interface.

The maximum fresh dynamic groundwater availability of 4071.81 Mm^3/yr has been assessed in Older Alluvium aquifer; followed by Phyllite & Schist (1379.34 Mm^3/yr), Younger Alluvium (1242.22 Mm^3/yr), Gneisses (B.G.C.) (789.21 Mm^3/yr), Bhander Sandstone (767.02 Mm^3/yr), Deccan Traps (527.20 Mm^3/yr), Vindhyan Sandstone (411.10 Mm^3/yr), Limestone (311.83 Mm^3/yr), Bilara Limestone (196.68 Mm^3/yr), Tertiary Sandstone (189.74 Mm^3/yr), Erinpura Granite (173.89 Mm^3/yr), Quartzite (164.79 Mm^3/yr), Shale (141.49 Mm^3/yr), Jalore Granite (101.97 Mm^3/yr), Gneisses (61.81 Mm^3/yr), Jurassic Sandstone (53.96 Mm^3/yr), Rhyolite (20.49 Mm^3/yr), Slate (6.35 Mm^3/yr) and Ultra Basics (2.94 Mm^3/yr).

The maximum saline dynamic groundwater availability of 1802.03 Mm^3/yr has been assessed in Younger Alluvium aquifer; followed by Older Alluvium (1358.19 Mm^3/yr), Tertiary Sandstone (129.71 Mm^3/yr), Phyllite & Schist (94.08 Mm^3/yr), Vindhyan Sandstone (57.28 Mm^3/yr), Jurassic Sandstone (33.15 Mm^3/yr), Erinpura Granite (32.43 Mm^3/yr), Bhander Sandstone (25.52 Mm^3/yr), Gneisses (B.G.C.) (22.02 Mm^3/yr), Rhyolite (19.19 Mm^3/yr), Gneisses (17.42 Mm^3/yr), Jalore Granite (12.30 Mm^3/yr), Bilara Limestone (9.56 Mm^3/yr), Quartzite (6.86 Mm^3/yr), Limestone (2.22 Mm^3/yr) and Slate (0.01 Mm^3/yr); while Deccan Traps, Shale and Ultra Basics aquifers does not contain any saline area.

Further Agro Climatic Zone wise details are presented in Volume 2 of this report.

Table 8.5 Block wise details of dynamic ground water availability in Agro Climatic Zones of Rajasthan

ACZ	District	Block	Hydrogeological Unit	Dynamic Groundwater Availability, Mm^3

8.9 Stage of Groundwater Development

Figure 8.18 present the stage of groundwater development for various blocks in Rajasthan as per Consultant's assessment for year 2010. The village-wise stage of development is given in Annex 6(b) as soft copy. According to these figures, the stage of fresh groundwater development ranges from less than 70% to more than 200%. Most of the blocks south-east of the Aravallis are over exploited i.e. groundwater development is >100%. Extreme over pumping is identified in the blocks and the large cities/towns such as: Jaipur, Alwar, Pali, and Chittaurgarh. Areas having low stage of development include most of the blocks north-west of the Aravali hill range, excluding few blocks in the districts of: Jaisalmer, Barmer, Jodhpur, Nagaur, Sikar, Jhunjhunu, Jalore and Sirohi. ACZ IVb is the only ACZ south-east of the Aravallis which has groundwater development below 100% (except for Arnod block of Pratapgarh district). These maps correlate well with the long term groundwater levels trends (Figures 8.5, 8.6) which present the unavoidable outcome of over-usage of the resource. Higher stage of development of more than 150% is observed in the almost entire Alwar district, Pisangan block of Ajmer district, Baytoo block of Barmer district, Balesar, Osian and Bawari block of Jodhpur district, Hindaun block of Karauli district, Lalsot block of Dausa district in the eastern half of the state and in the western half in the state in Bhinmal, Raniwara, Sanchore and Sayla blocks of Jalore district, Jaisalmer and Sankra blocks of Jaisalmer district and Dantaramgarh and Khandela blocks of Sikar district.

8.10 Categorization of Assessment Units

Figures 8.19 present the categorization of assessment units i.e. various blocks in Rajasthan as per Consultant's assessment for year 2010. The categories of assessment units are 'Safe', 'Semi Critical', 'Critical' and 'Over Exploited'. Accordingly, vast areas in

the north-west are characterized as 'safe' and their stage of development is below 100%, whereas areas with massive drafts and high stage of development are categorized as "Over-Exploited", such as in Jaipur and Alwar Districts. As can be clearly seen in the maps, most of the state is categorised as over exploited. The term over exploited represents a stage of development greater than 100% and both pre and post water level trends are showing significant decline in groundwater levels (>0.2 m/yr). Figure 8.19 presents an alarming picture of the groundwater scenario in the state of Rajasthan. The direct outcome of these conditions (which are already taking place in field) is that less water of lesser quality will be available for the people in rural areas as well as in the big cities. This is already reflected by declining water levels trends. These declining trends will lead to deepening of existing wells which will increase pumping in the areas. This might cause rise in salinity levels in many areas and thus, will make the groundwater quality unsuitable for drinking and irrigation use.

9. Detailed Groundwater Study by Agro Climatic Zones

9.1 Ground Water Study of ACZ Ia

The detailed groundwater study of Agro climatic Zone Ia in Volume 2a of this report. The related maps are given in Volume 3 of this report.

9.2 Ground Water Study of ACZ Ib

The detailed groundwater study of Agro climatic Zone Ib in Volume 2a of this report. The related maps are given in Volume 3 of this report.

9.3 Ground Water Study of ACZ Ic

The detailed groundwater study of Agroclimatic Zone Ic in Volume 2a of this report. The related maps are given in Volume 3 of this report.

9.4 Ground Water Study of ACZ IIa

The detailed groundwater study of Agroclimatic Zone IIa in Volume 2a of this report. The related maps are given in Volume 3 of this report.

9.5 Ground Water Study of ACZ IIb

The detailed groundwater study of Agroclimatic Zone IIb in Volume 2b of this report. The related maps are given in Volume 3 of this report.

9.6 Ground Water Study of ACZ IIIa

The detailed groundwater study of Agroclimatic Zone IIIa in Volume 2b of this report. The related maps are given in Volume 3 of this report.

9.7 Ground Water Study of ACZ IIIb

The detailed groundwater study of Agroclimatic Zone IIIb in Volume 2b of this report. The related maps are given in Volume 3 of this report.

9.8 Ground Water Study of ACZ IVa

The detailed groundwater study of Agroclimatic Zone IVa in Volume 2c of this report. The related maps are given in Volume 3 of this report.

9.9 Ground Water Study of ACZ IVb

The detailed groundwater study of Agroclimatic Zone IVb in Volume 2c of this report. The related maps are given in Volume 3 of this report.

9.10 Ground Water Study of ACZ V

The detailed groundwater study of Agroclimatic Zone V in Volume 2c of this report. The related maps are given in Volume 3 of this report.

10. Life Expectancy of Aquifer Systems

Life expectancy estimations of the hydrogeological units are presented in Figure 10.1-10.2 and in Table 10.1. The assessment was carried out for four target time steps/exploitation stages:

- Remaining availability of 90% of the saturated thickness
- Remaining availability of 70% of the saturated thickness
- Remaining availability of 50% of the saturated thickness
- Aquifer is exhausted - the entire utilizable saturated thickness has been exploited. Aquifer is not exploitable.

The life expectancy estimation of the aquifers was performed under the following main assumptions:

1) Future trends of groundwater levels will be similar to the average trends observed in the past 3 decades
2) No drafts decrease due to groundwater decline
3) No groundwater quality deterioration due to water table decline
4) Average permeability along the saturated profile is uniform

In nature, groundwater flows from zones of higher water level to zones of lower water level. Therefore, groundwater is expected to move towards the developing depressions in the water table. The expected outcome as a result of the lateral flows would be expansion of the depression zones area but probably a somewhat smaller average degree of decline. It is assumed that crossing the limit of under 50% of the saturated thickness has far reaching consequences related to: (a) lateral flows in the aquifer from adjacent areas (b) decrease in groundwater recharge (c) increase in production energy (d) deterioration in groundwater quality etc. The actual processes, their consequences and extent are impossible to predict without modelling and should be avoided by all means. These processes might also take place at earlier stages, before reaching 50% utilization of the saturated thickness, depending upon the local characteristics of the aquifer, surrounding hydrological conditions and the groundwater flow regime. It is therefore emphasized that responsible groundwater management scheme should always aim towards a sustainable groundwater exploitation within the annual replenished quantities. The following results should not be taken as recommendations for a groundwater abstraction scheme but should be used for understanding the severity of

aquifer conditions in various places in Rajasthan. The objective of this chapter is not to give accurate figures of the available volumes of groundwater in the state in the future but rather to serve as a tool for decision makers for understanding the processes and possible outcomes of today's management policy of the water resources in the State. The development of zones with depleted water table and the fact that the groundwater conditions (quantity and quality) are deteriorating in time - is reflecting the unbalanced exploitation above the sustainable potential.

General methodological guidelines are presented below:

- Long term trends of groundwater levels were analyzed based on RGWD and CGWB data between 1984-2010.
- Average rates of decline/rise of groundwater level per well were calculated.
- Saturated thickness of the various aquifer units was calculated based on 'depth to bedrock' data and '2010 groundwater level' data.
- Utilizable saturated thickness of the aquifer units were retrieved from the static resource estimations.
- Target stages of the aquifer storage were determined at 90%, 70%, 50% and 0% remaining saturated thickness with respect to the saturated thickness in 1984.
- The aquifers in most of Rajasthan are over-exploited for many years. Therefore, the reference storage for the life expectancy estimations was taken as the conditions in 1984, the earliest available full record for the entire state.
- Based on the long term decline/rise rates the year in which the saturated thickness will reach each target stage was assessed.
- Point data was interpolated into a continuous surface layer using IDW interpolation (ArcGIS toolbox). Search radius parameter was set to 12 points.

The life expectancy is displayed as the relativity decay time (in years) from the initial available saturated thickness of the aquifer (set as the saturated thickness in 1984) until each of the above four stages (90%, 70%, 50%, 0% of the saturated thickness) is reached. The time calculation is expressed as:

$$\Delta t_{[y]} = \frac{S_{(1984)}\ (P-1)}{R} * 100$$

Where:

Δt -	*Number of years from 1984 [y]*
$S_{(1984)}$ -	*Available saturated thickness in 1984 [m]*
P -	*Relative decrease in saturated thickness [no units]*
R -	*Long-term trend of change in groundwater levels [m/y]*

The findings of the above calculations are alarming. The prediction map of the "half life time" (50%) presents the initiation of the depression zones which will be the centroid of the future depleted aquifers. Until 2050 the extent of those centroids expands dramatically and can be clearly identified parallel to and alongside the north-

western slopes of the Aravallis and on the south-eastern side of the northern section of the range (Figure 10.1). Until the year 2100 significant parts of the aquifers in ACZ's: IIa, IIb, IIIa and IIIb are expected to be fully exhausted (Figure 10.2). This means that groundwater will become unavailable for most of the people in the most populated regions of the State of Rajasthan (either because of depth or quality, see figure 10.1). Furthermore, most of the other areas in those ACZ's will reach the stage of 50% availability of saturated thickness between the years 2050 to 2100. Rapid decline in the water table might have another significant consequence in the form of lateral inflows into the zone of depression. In the case of a near-by saline groundwater, the declining water table will draw saline water into the fresh zone, causing salinization of fresh aquifers and wells (see below the case of the Yamuna Basin in ACZ IIIb).

The results reveal a distinctive pattern exhibiting three longitudinal strips that cross the state from the southwest to the northeast, parallel to the Aravallis (refer Figure 10.1 - 10.2 and Table 10.1):

1) **Southeastern strip**: south of the Aravallis within the Chambal and Mahi Basins including ACZ's: IVa, IVb, V and the southern parts of IIIa and IIIb.
2) **Middle strip**: between the Aravallis in the southeast to the Outside Basin in the northwest including ACZ's: IIa, IIb, southeastern part of Ia and northern parts of IIIa and IIIb.
3) **Northwestern strip**: mainly within the Outside and Ganganagar Basins including ACZ's Ib, Ic.

The southeastern strip is characterizes by high precipitation and a relatively small depth to the water table while the main hydrogeological units are the hard and fractured aquifers such as phyllite and schist with a relatively low transmissivity. This region is also characterized by a large number of agricultural projects. These conditions enhance the natural recharge as well as the artificial recharge (return flow from irrigation). Therefore until 2050 most of the hydrogeological units still hold 80% to 100% of the full storage (Table 10.1). Yet between the years 2050-2100 the saturated thickness declines below 70% Table 10.1). The more severe conditions are observed mainly in the northeastern part of the strip (around the districts of Tonk and Baran). A unique phenomenon is observed around the blocks of Deeg, Kumher and Bharatpur in ACZ IIIb exhibiting close to stable saturated thickness followed by a rise in groundwater salinity (see ACZ IIIb, Figure 10.1). These observations reflect lateral inflows of saline groundwater into Rajasthan from the Yamuna Basin controlled by the declining water table around these blocks.

In the middle strip development of depression areas can be identified already from 2010 especially in the Districts of Pali, Jalore (along the alluvial plains of the Luni River), Nagaur, Sikar and Jaipur. In most of these areas the static groundwater level in 2010 was shallow (40m and below), corresponding to a limited groundwater storage. Until the year 2050 the depression zones expand extensively and present a strip in which the static storage drops below 70% and at places below 50%. When comparing between the static storage trends and the hydrogeological map it appears that correlation can be found between the areas of the developed depressions and the alluvial aquifer formations. This is attributed to the usually shallower depth and higher transmissivities of the alluvial aquifers making them preferred ground for intense agriculture activity.

The northwestern strip is characterized by a stability in the saturated thickness controlled mainly by the large amounts of water leaking from the Indira Gandhi Nahar Project (IGNP). Although the saturated thickness is likely to increase, this increase is expected to be followed by a significant increase in the salinity of the aquifer as well (See Chapters 1.12.3 in ACZ's Ib and Ic and Figure 10.1). This is attributed partially due to the local hydrogeological conditions and high potential evaporation in the Thar Desert and partially related to salinization processes of the canal's water along its course due to direct evaporation (open canal). In the northeastern tip of the strip, within Hanumangarh district (ACZ Ib) a severe depletion of the aquifer is taking place with <50% of the groundwater storage remaining in 2050. This area is the upper most section of the Ghaggar Basin which might explain the exceptional behaviour of this section compared to its surrounding. This is attributed to relatively limited surface area available for recharge which is hydraulically disconnected from the adjacent areas (no compensation by lateral flows).

Table 10.1 Life Expectancy of the Aquifer Units – predicted available saturated thickness (with respect to 2010 saturated thickness levels)

Color key legend:
Up to 2040 (< 31 years)
2041-2080 (31 - 70 years)
2081-2120 (71 - 110 years)
2121-2160 (111 - 150 years)
2161-2200 (151 - 190 years)
Beyond 2200 (> 190 years)

11. Recommendations for New Exploratory Wells

The main objective of the suggested new exploratory wells is to expand the hydrogeological knowledge about the aquifer units in Rajasthan and to fill in some of the main existing data gaps. It is believed that data collected from these wells might improve groundwater recharge and groundwater balance assessments. In some of the cases, the new exploratory wells might aid in the development of new and yet unknown groundwater resources. In general, the information that is expected to be gained from the new exploratory wells can be classified into three main data types:

1. Hydrogeological mapping data
   - Demarcating boundaries of aquifer units
   - Identifying boundaries of groundwater basins in places of uncertainties
   - Mapping depth to basement in un-known areas

2. Aquifer properties data
   - Measuring aquifer hydraulic properties in un-investigated areas
   - Measuring aquifer hydraulic properties in un-investigated formations
   - Measuring aquifer hydraulic properties in areas of extreme water table depletion to check changes in aquifer characteristics
   - Explore deep aquifer units

3. Groundwater flow regime information data
   - Adding data regarding groundwater levels
   - Retrieving information about groundwater qualities
   - Identifying boundaries of fresh-saline interface zones
   - Assessment of lateral flows along the international and national borders

Ninety-seven new exploratory wells are suggested (Table 11.1, 11.2 and Figure 11.2). Figure 11.1 presents a flowchart which demonstrates the conceptual model for locating a site for a new exploratory well and determining the required depth of the well. The principal points of interests are areas with shortage of data (no wells / shallow wells) regarding: chemical quality (mainly chloride), boundaries between hydrogeological units, boundaries between water bodies of different quality characteristics and to study the lateral inflows/outflows into neighbouring states (within India) and lateral inflows/outflows through the international border (into Pakistan). The necessity of new wells in these points of interest was examined; Inter alia the proximity and depth of existing wells and the properties of the underlying hydrogeological formation. Usually, the depth of each new well was set to the estimated depth of the basement rock, except for the wells that explore the alluvium formations. In the Younger and Older Alluvium formations, it is suggested to continue drilling 50 m within the basement rock in order to test the properties of the deep basement units and examine their suitability for groundwater exploitation. 17 wells out of the recommended new exploratory wells are very close in location to some of the new monitoring wells that are suggested in the optimization plan for the monitoring network (see Table 11.2 and Volume 4) and thus, these wells can serve both purposes.

Figure 11.1: The conceptual process for locating new exploratory wells

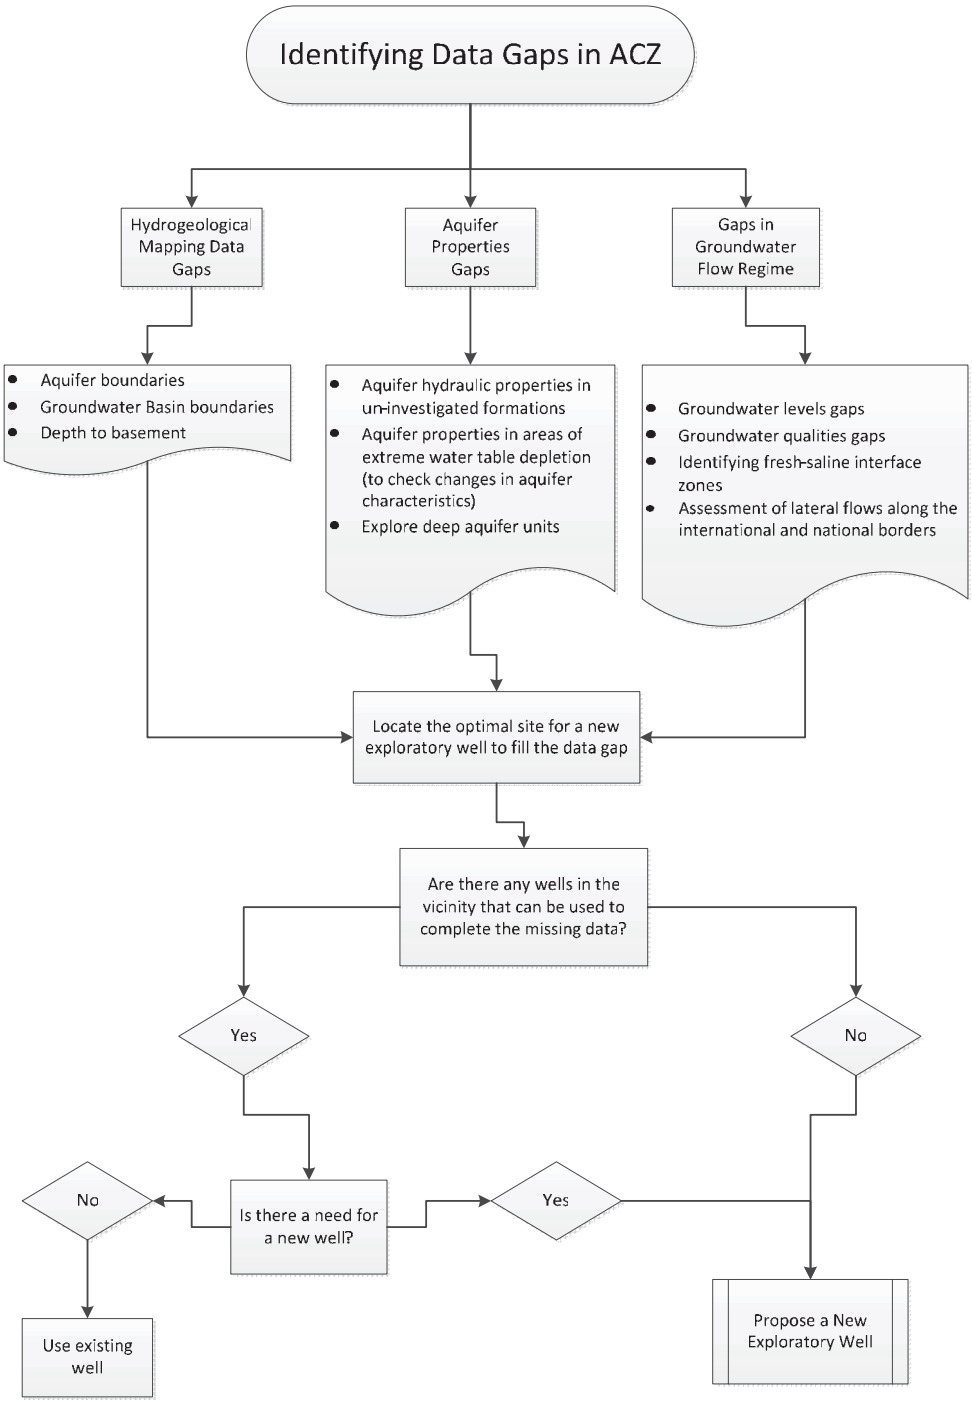

Table 11.1: Summary of Proposed New Exploratory Wells by ACZ's and Aquifer Units

Aquifer Unit / ACZ	I(a)	I(b)	I(c)	II(a)	II(b)	III(a)	III(b)	IV(a)	IV(b)	V	Summary

* Final depth might vary according to thickness of Alluvium. Borehole should be extended 50 m bellow base of Alluvium and into the bedrock.

12. Sample Survey of Groundwater Monitoring Stations

A field verification survey of selected water level monitoring stations/ observation wells which include piezometers maintained by CGWB, RGWD and public wells mentioned by village panchayats as well as private owners was carried out by consultants in all 33 districts covering all 10 Agro climatic Zone during the period may 2011 to April 2013. The details of Peizometers and monitoring wells are given below in Table 12.1.

Table 12.1 Agroclimatic Zone Wise number of Hydrograph Stations Checked in Rajasthan

S. No.	Agro Climatic Zone	District covered	Number Hydrograph Stations Checked
1	Ia	Barmer, Jodhpur	18
2	Ib	Ganganagar, Hanumangarh	14
3	Ic	Bikaner, Jaisalmer, Churu (Ratangarh, Sardarsahar, Sujjangarh blocks)	24
4	IIa	Churu (Churu, Rajgarh, Taranagar blocks) Jhunjhunun, Nagaur, Sikar	30
5	IIb	Barmer (Siwana block), Jodhpur (Bilara & Bhopalgarh blocks) Jalore , Pali, Sirohi (Reodar, Sirohi, Sheoganj blocks)	33

10	V	Baran, Bundi, Jhalawar, Kota, Sawai Madhopur (Khandar & Sawai Madhopur blocks)	53
11	IIIa	Jaipur Urban Area	15

12.1 Hydrograph Network Stations

Hydrograph stations network comprises both piezometers and dug wells spread over all 33 districts of Rajasthan, belonging to Central Ground Water Board (CGWB) and Rajasthan Ground Water Department (RGWD). The consultants have conducted field visits for random checks of both CGWB and RGWD hydrograph stations. The status of these hydrograph stations along with findings and suggestions for improvement are described in the following paragraphs:

12.2 Visited Hydrograph Stations

The hydrograph stations were visited after necessary discussions initially with CGWB and RGWD officers at Jaipur and subsequent discussions with respective field Hydrogeologist in-charge of districts during the field visits. Locations of the hydrograph stations indicated by the area hydrogeologist were not appropriate as a

consequence it became difficult to locate them independently in the field all over the state. After the monsoon season, the hydrograph stations in the field or along road side were found covered due to the growth of weeds and bushes that took considerable time in majority of cases to search and approach them. At times, the assistance of the local people was also not helpful, as the piezometer sites were encroached upon by local construction activities. Except some piezometers constructed & painted under EU-SPP programme, majority of the piezometers were found rusted and paint removed in some of them. CGWB piezometers (converted from exploratory tube wells) were not found properly protected by construction platform around it, while RGWD piezometers are mostly found protected by a properly constructed platform around it. Despite the best efforts made, a few piezometers remained untraceable for the want of proper location details. The list of checked hydrograph station sites is presented in Table 12.2.

12.3 Status of Hydrograph Network Stations Visited

In order to verify the present condition of the peizometers and observation wells (monitoring station) field visit was conducted during the period may 2011 to April 2013. The verification of these locations was carried out keeping in view the following criteria.

(i) Suitability of the site and its location.
(ii) Platform, if constructed is in a proper condition or damaged.
(iii) Peizometers properly painted or not.
(iv) Peizometers caps and bolts are in proper working condition or absent.
(v) Peizometers are in working condition or blocked.

Table 12.3 Present Status of Hydrograph Stations

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
(1) District : Jaipur								
1	RGWD Premises Jaipur	Piezometer	Not painted. Platform constructed	RGWD Premises Jaipur	RGWD Premises Jaipur	-	-	DWLR. Installed
2	Hathi Gaon	Piezometer	Not painted. Platform constructed	Near Moksh Dham	Near gate of Moksh Dham	35.40	34.20	
3	Chandwaji	Piezometer	Not painted. Platform constructed	Near Petrol Pump	Near Primary Health Centre away from Petrol Pump, In school ground	90.33	89.23	
4	Manoharpur	Piezometer	Painted in blue colour. Platform constructed	Gram Panchayat	Outside Gram Panchayat near gate	61.46	60.36	EU- SPP. DWLR. Installed
5	Nagal Purohit	Piezometer	Not painted. Platform not constructed	Nagal Purohit Village	In premises of Cooperative Society	43.80	43.02	
6	Raja Rampur	Piezometer	Painted in blue colour. Platform constructed	Raja Rampur Village	On link road, outside village school	39.11	37.97	EU-SPP. DWLR. Installed
7	Chomu	Piezometer	Not painted. Platform not constructed	Near PHED Water Tank	Opposite SDM Office by the side of PHED Complex	86.04	85.17	
8	Dhodhsar	Piezometer	Not painted. Platform not constructed	Dhodhsar village	Opposite Govind Dairy on Kachha field route, close to highway	40.75	40.27	
9	Chaksu	Dug well	Old well	Chaksu town, Kumar well	On Chaksu –Kothun road, opposite poultry farm	14.40	13.70	
10	Durgapura	Piezometer	Not painted. Platform not constructed	Durgapura Campus on Tonk road	Durgapura Campus on Tonk road	-	-	
11	Bassi	Piezometer	Not painted. Platform not constructed	Near Railway Station Bassi, Plate form No.2	Outside Railway station, on railway gate road	36.50	35.02	
12	Dudu	Dug well	Old well	Public Well	Public Well	18.50	17.70	

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
(2) District : Alwar								
13	Kishangarh Bas	Dug well	Old well	Near RSEB grid substation (GSS)	Near RSEB, outside on right side	17	-	Dry
14	Kishangarh Bas	Piezometer	Not painted. Platform not constructed	RSEB grid sub station	Inside premises of new RSEB grid sub station	34.31	33.64	
15	Harsauli	Piezometer	Not painted. Platform not constructed	Village Harsauli	Near Arrah Machine, opposite side	22.70	22.00	
16	Tatarpur	Piezometer	Covered by grass	Tatarpur village	Near temple on left side of road	43.20	42.20	
17	Jindoli	Piezometer	Not painted. Platform not constructed	Jindoli village	In Jindoli village	44.95	43.95	
18	Baroda Meo	Piezometer	Rusted. Not painted. Platform not constructed	Baroda Meo Village	On road side	-	-	Not operate able
19	Kathumar	Piezometer	Painted. Platform constructed	Panchayat Samiti	Near BDO office in Panchayat Samiti Complex	-	-	EU- SPP. DWLR. Installed
20	Kherli	Piezometer	Not painted. Platform not constructed.	Kherli village, on National Highway	On NH-11, on crossing railway gate, Bandikui-Agra rail Line	25.04	23.94	
21	Rajgarh	Piezometer	Not Painted. Platform constructed	Near Hanuman temple , BDO Office Complex	Inside BDO Office Complex	33.42	32.17	
22	Rajgarh	Dug well	Old well. Lined	Near Hanuman temple	Near Shiv/Hanuman temple, close to railway crossing gate	-	-	Dry
(3) District : Bharatpur								
23	Bhusawar	Piezometer	Casing pipe tilted. Not painted. Platform not constructed	Bhusawar village, near Police Station	Outside Police Station, on left side of Gate close to boundary wall	13.30	12.34	Partially damaged
24	Jagjivanpur	Piezometer	Not painted. Platform damaged	Village School	Inside Primary School, near gate	-	-	Cap very tight. Not operatable

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
25	Weir	Piezometer	Not painted, Platform not constructed	Weir Village	In Panchayat Complex	21.05	19.99	
26	Bayana	Piezometer	Painted in green colour, Platform constructed	In college premises	In college premises	26.13	24.90	EU.SPP. DWLR. Installed
27	Kot	Dug well	Old well	Kot village, near Pond	Near Pond in village	4.80	3.34	
28	Jaisora	Piezometer	Not painted, Platform not constructed	Jaisora Village	On Bayana – Bassin road, right side, near hand pump	7.13	5.51	
29	Halaina	Piezometer	Not painted. Platform not constructed	Near 94 km stone on NH-11 Agra road	Near farmers house in Tilchabi village periphery	-	-	Cap welded. Water level not measurable
30	Nadbai	Tube well	Converted into Piezometer	Near Nadbai- Nagar road junction	Near 'T' junction of Khejdi road, about 150 m distance from 'T' junction	15.60	14.60	
31	Rampur	Dug well	Old well. Lined	Village well near 59 km stone of Agra Road	59 km stone Agra road, about 4 km away from Bharatpur towards Jaipur side	6.00	5.00	Drinking water well
32	Rampur	Piezometer	Painted in green colour. New Piezometer	On Agra road near Bharatpur	On Agra road km stone 58.5 opposite Chandrawati group of Industries Building complex	-	-	Cap tightly fitted
33	Bharatpur	Piezometer	Not painted. Platform not constructed	Near chungi, behind Railway station	Behind railway station, on old tube well, on saunkh Govardhan road	30.60	29.92	
(4) District : Dhaulpur								
34	Kukra	Piezometer	Painted in green colour. Platform constructed	Village kotra on road side	At 'T' junction on basson road	2.80	1.90	EU-SPP. DWLR. Installed

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
35	Khindora	Piezometer	Not painted. Platform not constructed	Khidora village	Near school, on road side 3 km from Baseri-Bari road	-	-	Cap tightly fitted. Water level not measurable
36	Bhatesar Kalan	Dug well	Well situated in water logged area	On Baseri-Bari road	On Baseri- Bari road near old farm before 'T' junction	0.90	0.07	
37	Sar Mathura	Piezometer	Not painted. Platform not constructed. Surrounded by bushes	Near DSP office on Karauli Road	In Hostel complex premises, close to local pond,	-	-	Not approachable
38	Dhaulpur	Piezometer	Covered by stones	Inside PHED Compound	PHED Compound on Agra-Gwalior road	14.20	14.15	Stones removed for measurement
39	Dhaulpur	Dug well	In unused condition	Inside Circuit House / PWD Dak Bungalow	Close to LHS of main gate, near staff quarters	15.30	13.80	
40	Bari	Dug well	Very old dug well. Covered by steel frame	Near Bus Stand in Police Chowki Campus	In Police Chowki Campus	14.30	13.20	
41	Bari	Piezometer	Not painted, Platform constructed	In Krishi Upaz Mandi	In Krishi Upaz Mandi, on right side of the main state	11.81	10.86	
(5) District : Karauli								
42	Hindaun	Dug well	Old well	Near Bus stand Hindaun	Nagar Palika dugwell, Hindaun	3.20	2.05	Drinking water well
43	M.Ibrahimpur	Piezometer	Not painted. Platform constructed	Near GSS	Inside GSS in one corner, close to boundary wall on right side of gate	3.70	3.45	
44.	Langra	Piezometer	Rusted. Not painted	In village Langra, right side of road	Near Veterinary Hospital on higher ground	10.74	10.49	
45.	Karauli	Piezometer	Painted. Platform constructed	Outside Forest Department	Near DFO office main gate on Kailadevi road side	24.74	24.14	

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
46	Kailadevi	Dug well	Old well. Lined	Kailadevi Dug well Chandiwari (DW)	In premises of Chandiwari Saraf Dharamshala	2.12	.76	Located near local stream
47	Sapotra	Dug well	Old well. Lined	In Irrigation office	In Irrigation office premises	9.40	8.52	
48	Sapotra	Piezometer	Not painted. Platform constructed	PHED Campus	PHED Campus near local hill range	30.25	29.15	
49	Khera Bhavpura	Piezometer	Rusted. Not painted. Cap very tight	In primary school	Outside middle school along road side Dhaulpur to Karauli	-	-	Not operate able
50	Khera Bhavpura	Dug well	Old well. Lined	Close to the school	Close to the school	13.30	12.50	
51	Karauli	Piezometer	Painted. Platform constructed	Outside Forest Department	Near DFO office on Kailadevi road	26.04	25.44	New Piezometer
52	Gerakhera	Piezometer	Not painted. Platform constructed	Gerakhera village	Along road side, near temple, Gerakhera	12.01	10.83	
(6) District : Sawai Madhopur								
53	Gangapur City	Dug well	Old well	Madholal, well owner	Kanhya lal S/o Madho lal Halwai well on Jaipur road	2.35	1.60	
54	Sitor	Piezometer	Painted. Platform constructed	Satod village	On Gangapur- Lalsot road in village Sitod	10.70	9.82	
55	Kherli	Piezometer	Not painted. Platform constructed	Kherli village, near School	On Gangapur-Lalsot road in Govt. School	15.65	14.57	
56	Bamanwas	Dug well	Old well	Village Bamanwas	Near Sheetlamata temple, village on Piplai-Garh Mora road	3.50	3.10	
57	Kushtala	Dug well	Old well	Kushtala village	On Tonk - Sawai Madhopur road, opposite local market	13.78	12.38	
58	Kushtala	Piezometer	Not painted. Platform constructed	PHED Premises on Mega Highway	Outside PHED premises, near boundary wall, Megha Highway	14.04	13.10	

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
(7) District : Sikar								
59	Sargoth	Piezometer	Painted. Platform constructed	Village Sargod	On Jaipur – Sikar road, in village sargod	45.56	44.45	EU – SPP. DWLR. Installed
60	Ringus	Piezometer	Not painted. Platform not constructed	Near BSNL office Building	By the side of BSNL Building, close to boundary wall	40.25	39.71	
61	Bhopatpura	Piezometer	Not painted. Platform not constructed	Ringus – Sikar road, Village Bhopatpura	Bhopatpura Link road	48.50	-	Dry
62	Bhopatpura	Piezometer	Not painted. Platform constructed	On Ringus – Sikar road, Bhopatpura	On Ringus – Sikar road, inside Shamshan	47.02	46.15	
63	Bawari	Piezometer	Not painted. GI pipe casing. No platform	Bawari village	Secondary School premises	41.95	40.35	
64	Palsana	Piezometer	Painted. Platform constructed	Palsana village near Anaj Mandi	After crossing the village, Anaj Mandi and RIICO, near Laxmi Dharm Kanta (Weight Machine)	44.44	43.48	EU – SPP. DWLR. Installed
65	Ranoli	Piezometer	Painted. Platform constructed	Ranoli village	Ranoli village	34.03	33.19	
66	Gokulpura	Piezometer	Not painted. Platform not constructed	On road link from highway to Sikar town	Near Shamshan area, on road	55.19	54.21	
67	Lachhamangarh	Piezometer	Not painted. Platform constructed	On road side, before Lachhamangarh	Left side of road, near old Chungi	63.13	62.17	
(8) District : Jhunjhunu								
68	Mukandgarh	Piezometer	Rusted. Not painted. Platform not constructed	Mukandgarh – Mandawa road, at 1 km	Near Shamshan on Mandawa road	50.54	49.45	
69	Mandasi	Piezometer	Rusted. Not painted. Platform not constructed	Mandesi village	Mukandgarh – Jhunjhunu road, in village Charagrah, right side road	54.64	53.91	

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
70	Dhigal	Piezometer	Rusted. Not painted. Platform not constructed	Dhingal PHC	Inside PHC, back of building	52.21	51.57	
71	Jhunjhunu	Piezometer	Not painted. Platform constructed	Near Widow Hostel, on link Rasta 'T' Junction	Zila Parishad in Vicinity, Widow Hostel, Agriculture office campus nearby	65.30	64.62	
72	Jhunjhunu	Piezometer	Not painted. Platform constructed	In Beed Forest, near 8 km stone, road to Chirawa	Beed Forest, near 8 km stone on left of road towards Chirawa	49.20	48.26	
73	Khudana	Piezometer	Not painted. Platform constructed. Without cap open	Nirmal gaon Khudana, along Kantli river	Right side of Kantli river, on way to Khudana	65.53	64.47	
74	Chirawa	Piezometer	Painted. Platform constructed.	Chirawa town, in Agriculture Deptt. premises	In Agriculture Deptt. premises	-	-	EU – SPP. DWLR. Installed. Premises locked
75	Pilani	Piezometer	Painted. Platform constructed	BITS Pilani, Balika Vidhayala	Play ground of Balika Vidhayala BITS, Pilani	66.51	65.92	
(9) District : Churu								
76	Chandgothi	Piezometer	GI casing pipe, without platform. Not painted	On road side, near PHED premises	Close to Shop wall, outside PHED complex	67.27	66.62	
77	Nima	Piezometer	Not painted. Platform not constructed	Pilani – Rajgarh road, near GSS	Near GSS, by the side wall	49.20	48.12	
78	Hamirwas	Piezometer	GI pipe not painted. Platform constructed	Rajgarh road side ,near Police Station	Outside Police Station, along road side	41.10	40.37	
79	Rajgarh	Dug well	Old well	Sunaron ki Kui	On Taranagar road, near temple side Rasta	23.94	23.74	
80	Ratanpura	Piezometer	Not painted. Platform not constructed	Rajgarh – Churu road	Before village entry, on right side road	25.82	24.72	
81	Lakhau	Piezometer	Not Painted. Platform Damaged	Rajgarh – Churu road PHED Campus	Outside PHED Campus	36.84	35.39	

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
82	Churu	Piezometer	Not painted. Platform not constructed	Near Narbada Farm House	On road side, left, before Narbada Farm	-	-	Tightly capped. Not measurable
83	Beenasar	Piezometer	Not painted. Platform damaged	Near GLR / PHED in village	On road side in village, block damaged	-	-	Tightly Capped. Not Measurable
84	Sardarshahar	Piezometer	Not Painted. Platform Not Constructed	Near Railway Station	Back side Railway station, on Bikamsar road, near Modern School	39.75	38.36	
(10) District : Nagaur								
85	Kuchaman	Piezometer	Not painted. Platform constructed	Middle School	Middle School premises	53.03	52.16	
86	Nimod	Piezometer	Not painted. Platform constructed	Near School in Nimod village	Outside Primary School, near boundary, on Didwana road	57.48	56.90	
87	Maulasar	Piezometer	Not painted. Platform not constructed	Village Maulasar	Near electric transformer, on link road	61.26	60.88	
88	Nimbi	Piezometer	Not painted. Platform constructed	Near School	On Link road to Nimbi, outside village School	36.54	35.71	
89	Koliya	Piezometer	Not painted. Platform constructed	Near village Koliya on Jayal – Didwana road	Opposite Baldwa Hospital, near shahid smarak	14.27	13.65	
90	Khuri	Piezometer	Not painted. Platform constructed	Opposite pond and school	On Sonia link road, opposite pond and village school	25.90	24.79	
91	Badi Khatu	Piezometer	Not painted. Platform not constructed	PHED Campus	Inside PHED Campus on National Highway to Nagaur	93.60	92.10	
92	Tarnau	Piezometer	Painted. Platform constructed	Village Tarnau	By school side on Degana road	53.00	-	Dry
93	Nagaur	Piezometer	Not painted. Platform constructed	Near nursery on Ladnu road	Near nursery on Ladnu road	26.90	26.16	

S. No.	Name of Hydrograph Station	Type of Hydrograph Station	Present Status	Location Details		SWL		Remarks
				Indicated	Observed	m, bmp	m, bgl	
(11) District : Bikaner								
94	Rasisar	Piezometer	Not painted. Platform constructed	Village Rasisar	Village Rasisar Piezometer	-	-	Tightly bolted. Not measurable
95	Pithrasar	Piezometer	Not painted. Platform constructed	Village Pithrasar	On 'T' Junction, on Kolayat road	106.20	105.73	Located in sand dune area
96	Kolayat	Piezometer	Not painted. Platform not constructed	Forest area village Kolayat	On 'T' Junction link road, in Forest area	69.20	68.40

346	Ravindra Munch	Piezometer	Not painted. Platform constructed	Near second gate of Ravindra Munch	Near second gate of Ravindra Munch, gate closed	55.65	55.42	

12.4 Comments and Suggestions

i) Both in rural and urban areas, piezometers are located in a disorderly manner at variable location.

ii) Generally the piezometers are located along road sides, in the premises of public buildings like schools and colleges, PHED and PWD campus, police chowki, krishi upaz mandi, forest department complex, panchayat samiti, cinema complex, tempo/bus stand, railway station level crossing, temple premises, public park and so on. The locations of these piezometers are not properly explained in the data sheets and due to this it becomes extremely difficult to trace them in the field by a new person visiting the sites. Therefore the location of the sites should be properly described on the data sheet so that it can be traced easily and should be updated from time to time.

iii) Locations of piezometers in borrow pit areas along, road sides, depressions or in the areas likely to be covered at the time of widening of roads cannot be considered as the proper site.

iv) Schools in village and town have increased in numbers both in public and private sectors, Hence, merely writing locations of piezometers in data sheets as in 'Schools' is not sufficient name of school along with its proper location should be recorded.

v) The piezometers located in schools are likely to be damaged by filling of extraneous materials into them by school children, as such the school authorities shall be made responsible to ensure their protection.

vi) Panchayat Sarpanches / Ward Members should be taken into confidence while locating sites for installing piezometers or fixing dug wells as hydrograph stations as at present number of these public representatives sarpanches are not exactly knowing the location and the purpose of hydrograph network stations in their area of Jurisdictions.

vii) A guideline for selection of piezometer sites shall be adopted in future for keeping safe distance from roads and other civil structures.

viii) Locations of new piezometers to be installed in future must also be fixed at assured safe places in a uniform pattern like in a panchayat office, in a village, at road-side petrol pump or a well-known hotel complex on roads in rural area, and in towns, Panchayat Samitis, Zila Parishad or Collectorate office, Dak Bungalow as permanent government building complex and in such a case the piezometer may be installed at proper location i.e. near the entrance gates of these offices, duly protected by a suitable cap or cover, clearly marked with code numbers on the piezometer block. Permanent buildings of RGWD in district towns, if available, should be preferred.

ix) Diameters of piezometer casings are not uniform, also the piezometer caps are of different designs causing problems of opening them at the time of recording water levels. It is advisable to follow a standard size of caps inner screw and bolt.

x) Old piezometers are likely to be covered at places by new constructions and encroachments, especially in urban areas, need to be properly relocated.

xi) Pumps on wells/ tube wells have been installed at places near the piezometers by the land owners which may affect the water level in piezometers needs to be relocated if possible or due care should be taken while recording to water level.

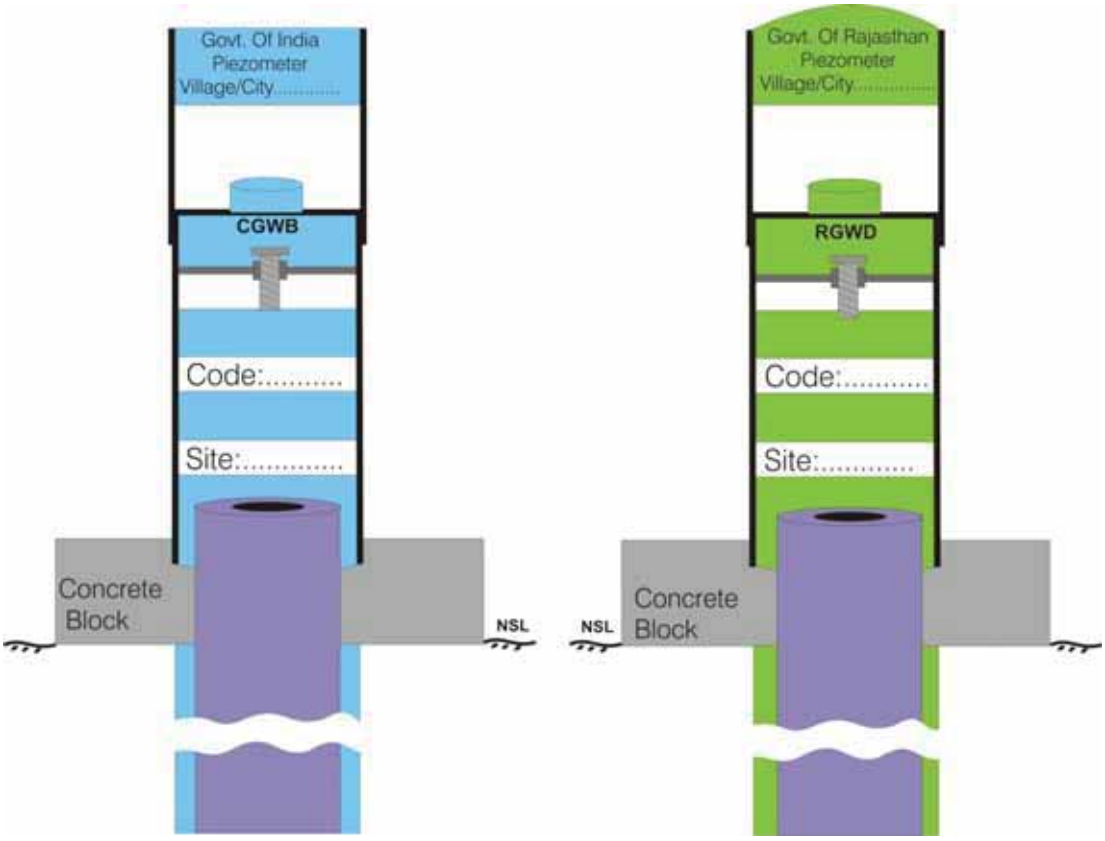
xii) Hydrograph stations in close vicinity of local nallah or ponds do not represent the actual water levels of the area, as such these may be replaced with other suitable hydrograph stations.

xiii) Periodic maintenance of the peizometers in respect of paint, platform, proper functioning of caps, nuts and bolt etc., is required.

xiv) Periodical painting of the piezometers is required for its protection. The proper design for this purpose can be adopted as indicated below. (Different scheme for CGWB and RGWD piezometers).

xv) At places the bolts fixed at inner heads of piezometers are not in proper alignment with other on the top caps, as such the measurements of water levels are not possible. This needs to be aligned properly.

xvi) It is suggested that the piezometers owned by CGWB and RGWD be painted with different colour. Piezometers of CGWB may be painted in blue, and RGWD piezometers - in green. The piezometers should be further marked with hydrograph station code number, agency in charge and location name, in three different rounded white strips on the body of the painted piezometers. The piezometers can be further protected with specially designed cover boxes on the top, painted with the same colour code as per the local requirement as depicted below.



xvii) Rain gauge stations should be established in vicinity of all such piezometers while DWLR have been installed on them.

xviii) The demand of water in urban area has tremendously increased resulting into excess withdrawal of ground water. Hence, the number of piezometers shall be increased in urban areas for both monitoring the changes in water table as well as in the quality at regular intervals.

xix) There are certain areas in the field where multiple aquifer system exists but only a single piezometer has been constructed. In such cases number of piezometers should be increased to monitor the behaviour of each aquifer.

xx) The hydrograph stations network in the Jaipur Urban area is commonly observed at many places by the CGWB and RGWD. DWLRs installed by RGWD on the piezometers located at Raj Bhawan and in RGWD office premises were also observed by the consultant.

xxi) The efforts being made by CGWB and RGWD for periodical monitoring of groundwater levels in adverse field conditions deserve all appreciation but the system needs modernization and reforms.

13. Optimization of Groundwater Monitoring Network

Groundwater monitoring in the state is being done through an existing network of observation wells and peizometers of CGWB and RGWD. The water levels are measured during pre-monsoon and post monsoon seasons. Water samples for chemical analysis are also collected during the course of the survey in both the seasons.

These monitoring stations are distributed among the 19 hydrogeological units all over the state. At some places the density of locations is very high whereas it is low in many other parts. In the areas where the wells are located in close proximity a good number of wells are of practically no utility where as in the areas of thin density, valuable data for proper assessment of groundwater quantity are not available. There are areas in the state where there is frequent variations of rise and decline of water levels due to heavy exploitations, such areas require close monitoring in order to understand the proper reasons of rise/decline. In respect of groundwater quality assessment, there are big gaps in certain areas of the state where sufficient data are not available for proper assessment of groundwater quality and to understand the reasons of deterioration in chemical quality.

In view of the above stated reasons it has been felt necessary that improvement in the existing groundwater monitoring network is required in order to properly asses and manage the available groundwater, both quantitatively and qualitatively. For this purpose more groundwater monitoring stations are required to get adequate/additional data to fill up the data gaps or enhance the database and in the dense areas, delete the monitoring stations to avoid extra-work. In order to improve the current monitoring network a detailed study for its optimization has been conducted and presented in Volume 4 of this report.

14. Recommendations

Based on studies of ground water carried out by agro-climatic zones in the state and having assessed the dynamics of ground water quality and quantity, the following recommendations are made.

1. Based on Groundwater Estimation Methodology (GEC-1997) along with modification in the subsequent years 2003/04. According to this methodology groundwater, recharge is estimated by way of water level fluctuation method. One critical parameter in recharge estimation is the specific yield of aquifers. The actual field data for which are not available for most aquifers and areas except with some sporadic values at places for alluvial aquifer system in state, as such assumed values of specific yield have also been used for current assessment of dynamic ground water recharge. It is therefore paramount that adequate data on specific yield of 19 aquifer systems in state be build up based on aquifer pumping tests on newly recommended exploratory wells. Pumping tests, if made mandatory for public water supply tube wells will further provide additional data on aquifers specific yield values to help refine estimates of dynamic ground water recharge.

2. Exclusive reliance on water-table fluctuation method of recharge assessment has produced fixed annual values of recharge. It is suggested that Chloride mass balance and Chlorine-36 isotope methods for estimating long-term average rates of deep percolation may be experimented as an alternative method. A two year study to test applicability of the two methods at two different sites is proposed. Such methods are ideal for arid and desert areas.

3. The annual abstraction of ground water exceed annual recharge availability, the assessment to monitor the trend of ground water development is done, at present at an interval of 4 years. It would be desirable if assessments are carried out annually to control use of annually available ground water.

4. Results of the study have indicated that regional water quality, particularly of alluvial aquifers in ACZ Ia, Ib, Ic and IIa has possibly been affected by the land use activities, which might have caused increasing concentrations of inorganic constituents such as Nitrates levels. Ground water beneath areas of irrigated crop land in alluvial and other aquifer is characterised by larger concentrations of hardness, calcium, magnesium, fluoride, nitrite plus nitrate. The affects are attributable to rates of infiltration and percolation through soil. The water dissolves minerals from soil and chemicals applied as fertilizer and transport them down to the aquifer. Though there is no pesticide surveillance in ground water as yet in state, the possibility of non-degraded pesticide in the aquifer exists. It is therefore, recommended to monitor the areas with problem of high nitrate levels.

   In view of above it is suggested to take up well designed studies towards (a) assessment of non-point source contamination of alluvial aquifer system, to begin with in the areas where increasing trends of nitrate levels are observed. Also it is desirable to plan setting upto key monitoring wells exclusively for monitoring and surveillance of pesticides in ground water, as well as monitoring the increasing trends of nitrite, nitrate and fluoride levels in ground water of various aquifers.

   Specific studies therefore need to be designed by State Ground Water Department to determine the effects of land uses on ground water quality. One of the studies could be planned in areas of

   i) Urban storm water disposal,
   ii) Over cultivation area associated with application of fertilizers and pesticides

5. The studies have carried out village-wise assessment of availability of dynamic ground water. The villages have also been classified into various categories *e.g.* safe, semi critical, critical, and over-exploited based on these assessment. It is suggested that RGWD should now develop, outreach and translate the dynamics of ground water to the farmers, or group of farmers & WUAs, in a simpler way, so that they can visualise the actual availability of this resource in their areas to make assessments on a regular basis for its development and for its use in domestic and irrigation and related needs.

6. In addition to this (as stated in point no. 5) it is also suggested that an intensive network of monitoring stations is setup in the areas where there is heavy exploitation of groundwater and the area which have come " under stress" (i.e. the areas where withdrawal of groundwater is more than the groundwater availability and mining has started). Such a network of peizometers in these areas should be installed with automatic groundwater level recorders and groundwater quality monitoring systems. This will enable in obtaining continuous and real time records of changes in water level and chemical quality in order to keep watch on the deteriorating conditions in the area. To begin with it is proposed that at least 5 such peizometers in each hydrogeological units may be installed covering all the 19 aquifer units in the state.

7. In view of fast depleting ground water resources and declining levels of ground water as a result of ground water over-draft, properly managed aquifer recharging should be made mandatory in the "over stressed" aquifers. The first and foremost thing is to identify suitable areas for groundwater recharge in over- stressed regions in over-exploited areas where area-specific and design specific recharging measures can be under taken keeping in view its climatic- geomorphological and topographic set-up of state. Percolation tanks with recharge shafts- especially over hard rock terrain, recharging ephemeral stream bed areas through construction of cascading barriers and check dams, flooding of dunal landscape with flash flood waters, promoting and upscaling farmers dug well recharge programme as well as arresting run-off at Aravalli Ridge-toe areas through specially dug lengthy stretches of trenches back-filled with boulders & gravels are some of the recharging measures considered suitable for the state. Recharge shafts and roof top rain water harvesting measures to augment local ground water in Urban and Institutional areas, where land availability may not be an issue can also be accelerated.

8. A separate programme on Repair, Renovation and Restoration, of all village ponds & tanks, be taken up on a time-bound basis which may be linked with MNREGA and RKVY Scheme of Ministry of Agriculture, Government of India. The work will include desilting of ponds and or constructing recharge shafts around such ponds particularly at intake points to help recharge ground water locally.

9. The study have assessed total static ground water resource for the state as 62,639.67 Mm^3 which include 32914.16 Mm^3 as fresh ground water static resource and 29725.51 Mm^3 as saline ground water resource. It is recommended that static resource (fresh) should not be exploited but, used as contingency measures, only to utilize during drought periods.

10. The study of the village-wise assessment of quality of ground water has revealed that 20663 villages in state contains non-potable water. In order to ensure safe quality of drinking water to the villagers a special programme in convergence with Ministry of Drinking Water and Supply, Government of India, shall help improve the health and hygiene status of people inhabiting such areas.

11. The present study have also revealed that 4,775 villages have unsuitable chemical quality of ground water and 36,827 villages have groundwater of suitable quality for use by livestocks. Livestock suitable plain needs to be prepared for raising livestocks in such brackish groundwater areas to establish drinking water stations based on tube well water supply from marginally saline ground water areas.

12. A Joint study by RGWD and state agriculture department may be conducted for using brackish/ saline groundwater to grow salt tolerant crops in the agro climatic zones where there is huge quantity of the brackish/saline groundwater available in shallow/ deep aquifers. Simultaneously a programme for use of brackish water and desalinisation of groundwater can also be considered on bilateral co-operation and donor assistance programme of the government.

13. It is generally observed that rain water in urban areas goes unutilised. Arresting run-off rain water and its storage for horticulture and related non-drinking water uses is proposed based on “Modular Rain Water Tank Technology” which can capture huge quantity of run-off in urban areas, run-off on highways.

14. As a measure towards improving groundwater availability in the over exploited areas RGWD should under take a programme of "Groundwater Resources Conservation and Management" for taking suitable measures to recharge the stressed aquifers. For this purpose RGWD should be suitably strengthened and a 'Cell' for recharging groundwater should be setup to unsure recharging operations on a regular basis.

15. The on-farm water management (OFWM) world over have found utility in improving irrigated agriculture water use efficiencies. It is proposed that state should make use of available technologies such as laser land levelling, ditch and furrow methods of irrigation using tensiometer for affecting crop-water use, on-farm pond development including crop-diversification through micro-irrigation (Drip) based system particularly in over-exploited and critical blocks with a view to conserve this precious and rapidly exhausting resources.

Based on the above recommendations a combined Action Plan has been prepared as given in Table 14.1.

Table 14.1 Action Plan based on Recommendations

S. No.	Recommendations	Proposed Actions	Anticipated Value Addition	Responsibility
1	Monitor groundwater levels, groundwater quality and groundwater development in the State	• Observe the groundwater levels and groundwater quality on regular basis (4 times in a year) with groundwater monitoring network and study their trend. (refer Section 1.10 and 1.12.3 of each ACZ analysis in Volume 2 of this report) • The assessment to monitor the ground water development and use is done at an interval of 4 years. It would be desirable if assessments are also made regularly on annual basis also for controlled use of annually available groundwater. (refer section 4.8 and 4.9 of Volume 1 - Main Report)	Improved accuracy and surveillance of groundwater levels and groundwater quality. Controlled use of annually available groundwater.	SWRPD and RGWD
2	Improve the database of specific yield for the benefit of refining estimates of dynamic groundwater recharge	Execute a field survey for conducting pumping tests on wells in each district. Also to conduct pumping tests on every new piezometer being installed.	Improved accuracy of groundwater assessment.	SWRPD and RGWD
3	Examine additional methods for evaluating groundwater recharge	Chloride mass balance and Chlorine-36 isotope methods for estimating long-term average rates of deep percolation may be experimented as alternative method. A two year study to test applicability of two methods at two different sites may be desirable. Such methods are ideal for arid and desert areas.	Alternative method of evaluating groundwater recharge. Present practices being adopted can be compared and cross-checked.	SWRPD and RGWD
4	Improvement of Groundwater monitoring network	• Additional 2745 monitoring wells should be installed and the existing 1351 duplicate ones or very close ones should be closed based on the recommendations of the optimization study of groundwater monitoring network in the report. (refer Volume 4 of this report) • Out of the existing 3518 dug wells considered under optimization study, 827 are proposed to be excluded	Improved accuracy and reduction in data collection.	SWRPD and RGWD

S. No.	Recommendations	Proposed Actions	Anticipated Value Addition	Responsibility
		from groundwater monitoring network, hence there is a need to replace the remaining 2691 dug well monitoring stations with piezometers. (refer Volume 4 of this report) • As per the water table decline trend (refer Section 1.10 of each ACZ analysis in Volume 2 of this report), 128, 124 and 44 piezometers are likely to go dry in 2020, 2040 and 2060, which shall need replacement in future.		
5	Monitor the presence of pesticides in the groundwater in areas of intensive agriculture/command areas activity, especially in locations faced with problems of high nitrate levels	• Undertake well planned/designed studies towards assessment of non-point source contamination of alluvial aquifer systems to begin with in areas where increasing trends of nitrate levels are observed. Setting up key monitoring wells exclusively for monitoring and surveillance of pesticides in groundwater, as well as monitoring the increasing trends of nitrates and fluoride level in groundwater of various aquifers. • Design specific studies to determine the effects of land uses on groundwater quality. Suggested sites can include: (a) Urban storm water disposal and the other (b) Over cultivation areas associated with application of fertilizers and pesticides. (refer Section 1.12.3 of each ACZ analysis in Volume 2 of this report)	Prevention of further deterioration of groundwater quality due to application of fertilizers and pesticides, resulting in improvement in groundwater quality in long-term.	SWRPD and RGWD
6	Conduct new exploratory drilling	• Exploratory drilling in the areas/locations as recommended in the report • Exploratory drilling of deep aquifers • Pumping test should be made mandatory for every	Improvement in data on aquifer boundaries, aquifer properties and depth to basement; and	SWRPD, RGWD and CGWB

S. No.	Recommendations	Proposed Actions	Anticipated Value Addition	Responsibility
		newly drilled well in the State (refer Section 11 of Volume 1 - Main Report)	identification of new aquifers.	
7	Outflow of groundwater resources	Conservation / exploitation of groundwater flowing to adjoining country. (refer Section 8.2 of Volume 1 - Main Report)	Proper utilization of State's groundwater resources.	SWRPD, RGWD and WRD
8	Restructuring and capacity building of Groundwater Department	• Conduct study on restructuring and capacity building of Groundwater Department, involving organisational capacity building, infrastructure capacity building and professional capacity building. • Creation of GIS Cell • Creation of Recharge Cell • Creation of Legal Cell	Improvement in overall working of RGWD.	SWRPD, RGWD and GoR
9	Better understanding, higher awareness and sustainable development of the groundwater resources by the farmers	Develop outreach and translate the dynamics of groundwater to farmers, group of farmers & WUAs to create understanding, awareness and sustainable development of the groundwater resources.	Enhancement in understanding, awareness and sustainable development of groundwater resources by farmers.	SWRPD and RGWD
10	Adopt on-farm water management (OFWM) practices	State should make use of Resource Conservation Technologies such as laser land levelling, ditch and furrow methods of irrigation using tensiometer for affecting crop-water use, on-farm pond development including crop-diversification through micro-irrigation based system particularly in over-exploited and critical blocks with a view to developing water use efficiencies. (refer Section 1.16.1 of each ACZ analysis in Volume 2 of this report)	Improvement in water use efficiency ultimately resulting in reduction in groundwater exploitation and groundwater level stabilization.	SWRPD, RGWD and Rajasthan Agriculture Department

S. No.	Recommendations	Proposed Actions	Anticipated Value Addition	Responsibility
11	Control on illegal drilling of wells and control on groundwater exploitation	• Registration of rigs to control illegal drilling of wells. • To frame a Groundwater Act to control the exploitation of groundwater.	Control on groundwater exploitation resulting in stabilization of groundwater level.	SWRPD, RGWD and GoR
12	Data upgradation	Creation of an online system of various groundwater data entry at district level linked with the GIS Cell for an upgraded and updated data bank.	Upgraded and updated data bank with ease to access.	SWRPD and RGWD
13	Improve, detailed and frequent monitoring of stressed aquifer systems	• Set-up key observation-wells in stressed aquifers where stage of ground water abstraction is much higher than dynamic annual groundwater availability. • Installation of 1197 digital automatic water level recorder as well as water quality monitoring system in a phased manner to enable obtaining continuous & real- time record of levels and water quality. • At least 5 key wells need to be installed on each of the 19 mapped major aquifer units in the state, to begin with. (refer Volume 4 of this report)	Control on groundwater exploitation in stressed aquifers.	SWRPD and RGWD
14	Promote Resource Conservation and Managed Aquifer Recharging measures towards improving water availability	• The proposed Recharge Cell under RGWD as one of its wing to discharge intended recharging work/ operation on continuing basis. • Designating ground water conservation areas (GCAs) in over- stressed aquifers where area-specific and design specific recharging measures be employed keeping in view the climatic-geomorphological and topographic set-up • Percolation ponds with recharge shafts • Recharging ephemeral stream bed areas through	Enhanced groundwater availability and stabilization of ground water levels and improvement in groundwater quality.	SWRPD and RGWD

S. No.	Recommendations	Proposed Actions	Anticipated Value Addition	Responsibility
		construction of cascading barriers and check dams • Promoting and upscaling farmers dug well recharge programme as well as arresting run-off at Aravalli Ridge-toe areas through specially dug lengthy stretches of trenches back-filled with boulders & gravels • Recharge shafts and roof top rain water harvesting measures to augment local ground water in Urban and Institutional areas. • Managed Aquifer Recharge programme may take benefit and develop convergence with Revised Master Plan for Recharging Ground Water (2013) prepared by CGWB, in which the areas feasible for recharge and types of structures to be constructed are given for consideration and implementation by State Government of Rajasthan		
15	Reduction of groundwater demand in over-exploited areas	Use of modern irrigation practices and technologies (pressurized irrigation) to reduce groundwater extraction for which subsidies are provided by GoR and irrigation during hours of low potential evaporation.	Reduction in over-exploitation resulting in stabilization of groundwater levels.	SWRPD, RGWD and Rajasthan Agriculture Department
16	Use of Fresh Static resources as contingency measures only	• Static resource (fresh) should not be mined but used only as contingency measures to be pressed into service and use only during drought periods • It is suggested if some groundwater sanctuary High Production wells could be constructed as regimes for supply in periods of distress & dire scarcity to serve as “Groundwater Sanctuary Parks”	Reduction in over-exploitation of groundwater and better management during situation of scarcity.	SWRPD and RGWD

S. No.	Recommendations	Proposed Actions	Anticipated Value Addition	Responsibility
17	Improve Quality of water supply to villages having non-potable water and link them to surface water schemes	A time based priority program to provide safe-drinking water based on principles of scientific source locations and well construction in convergence with Ministry of Drinking Water and Supply, Government of India, shall help improve the health and hygiene status of people inhabiting such areas.	Improvement in health and hygiene status of people in identified areas.	SWRPD, RGWD and PHED
18	Utilization of saline groundwater	• Drinking water stations for livestock should be raised based on tube well water supply from marginally saline groundwater resource areas. • Desalination and appropriate use of brackish water can be considered with donor assistance under bilateral corporation programme • Conduct experiments for developing use of brackish/saline groundwater for raising salt-tolerant crops where huge quantities of saline groundwater resides in shallow and deep aquifer systems	Utilization of saline groundwater resulting in reduced demand from fresh groundwater aquifers.	SWRPD, RGWD and Rajasthan Agriculture Department
19	Execute a programme on Repair, Renovation and Restoration of all village ponds & tanks	To be taken up on a time-bound programme which may have convergence with MNREGA and RKVY Scheme of Ministry of Agriculture, Government of India including desilting of ponds and or constructing recharge shafts around such ponds particularly at intake points to help recharge groundwater locally.	Enhanced recharge of groundwater.	SWRPD, RGWD and Rajasthan Rural Development & Panchayati Raj Department
20	Utilization of urban storm water	Arresting of Urban run-off and its use for horticulture, other non-drinking water uses and groundwater recharge is proposed based on "Modular Rain Water Tank Technology" which can capture huge quantity of Urban-run-off/ highway- run-off.	Enhanced recharge of groundwater and reduced demand of groundwater.	SWRPD, RGWD and ULBs

14.1 Action Plan for Long Term Management of Aquifer Systems

The long term management plan for groundwater exploitation in all the blocks of Rajasthan is given in Table 14.2. The action plan is block specific and suggests a different approach for each of the 4 main categories: safe, semi critical, critical and over exploited.

Over Exploited Blocks:

The action plan is based on 3 main stages:

Stage	Duration	Aim	Recommendation
Stage 1	2014-2020	Control of groundwater draft	Immediate control of groundwater draft with 2010 abstractions as the maximum permitted annual draft
Stage 2	2021-2040	Achieving balanced exploitation	Gradual reduction of -1% to -10% per year of groundwater draft until balanced draft is achieved (draft = availability)
Stage 3	2041-2060	Rehabilitation of the aquifer	Additional reduction of -1% to -10% per year of groundwater draft until target draft is achieved. Target draft should be <100% to allow for gradual recovery of groundwater levels and static storage.

Figure 14.1 and 14.2 presents a schematic illustration of the conceptual model for the recovery plan of the aquifers, presenting the three main stages described above.

The aim of stage 1 is to freeze current conditions and prevent further increase in the rate of decline of groundwater levels. This is suggested by controlling the constantly growing groundwater draft in the block and setting the 2010 draft value as the maximum permitted draft in the block, until 2020. The second aim of this stage (7 years) is to give sufficient time to prepare for the expected reduction in groundwater exploitation starting from 2020, either by developing alternative sources (i.e. surface water/ treated water) or by restricting agriculture activity or implementing more efficient irrigation technologies. The table gives the expected water shortage as a result of limiting the draft with respect to the projected increase in abstraction. The prediction for increase in abstractions was made based on the average increase from 1995 to 2009.

The objective of stage 2 is to reach balanced conditions where the groundwater draft will be equal to the dynamic availability. The target year for balanced exploitation was set to 2040. The quantity of over exploited groundwater in excess of the availability is reduced gradually and evenly along the period of 20 years between 2021-2040.

After many years of pumping in excess of the groundwater availability the over exploited blocks require a reduction in drafts to below 100% of the availability in order to allow for aquifer rehabilitation and rise of groundwater levels. The 3rd and last stage is directed to restore the aquifer's static storage. Since the original natural storage of the aquifers is not known, groundwater levels in 1980 were set as the target level for rehabilitation. The annual reduction in draft for the period 2041-2060 was defined by calculating the total over exploitation in the period 1980-2020 in Mm^3 divided by 20 years. Total over exploitation for the period 1980-2020 was calculated according to:

$$OE\ (1980\text{-}2020) = R * Sy * A * t$$

Where:

OE (1980-2020) = Over exploitation in the period 1984-2020 (Mm^3)
R = Rate of decline (m/y)
Sy = Specific yield
A = Area (m^2)
T = time period (2020-1980 = 40 years)

A limit of maximum reduction in draft of -10% per year was set in order to avoid too rapid and unrealistic decline rate which will be impossible to implement. In these cases full recovery to 1980 stages was not achieved in 2060. The percent of recovery at the end of stage 3 (2060) in each block is presented in the table (relatively to the storage in 1980).

At the end of stage 3 an assessment of the groundwater condition in each block should be performed according to the groundwater levels in 2060 and the rehabilitation plan should be stopped or expanded accordingly.

Critical Blocks:

In the semi critical blocks the stage of development is high but still below 100%. Therefore, it is suggested that in these blocks, groundwater exploitation will be limited to the draft in 2010 permanently, during all 3 stages. Yet, water shortage is expected to increase in time due to expected increase in demands. Because groundwater exploitation should not exceed beyond the draft in 2010 – alternative sources should be developed during the first stage or irrigation should be limited.

Safe and Semi Critical Blocks:

The safe and semi critical blocks present a stage of development significantly lower than 100%. The approach regarding these blocks is that some increase in groundwater abstractions is possible, according to expected increase in demands with time. However, an upper limit for draft of 95% of the dynamic availability was set in order to prevent over exploitation. Once this limit is reached, groundwater draft should stay constant accordingly and the water shortage should be balanced either by alternative sources or reduction in agriculture activity.

It is vital that the action plan in all blocks will be re-evaluated and modified if necessary, every 5 years according to actual drafts and groundwater table behavior.

Figure 14.1 Schematic illustration of the conceptual model for the recovery plan of aquifer units in over exploited blocks – groundwater draft

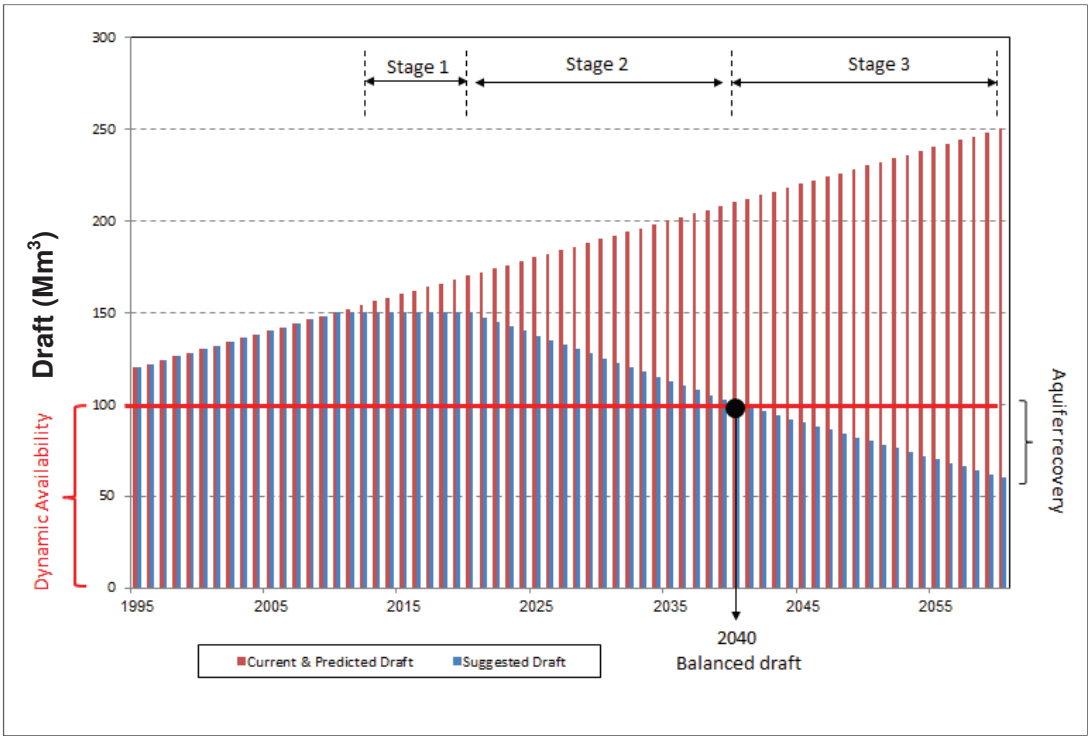

Figure 14.2 Schematic illustration of the conceptual model for the recovery plan of aquifer units in over exploited blocks – groundwater levels
